RENORMALIZATION OF HÉNON MAP IN ARBITRARY DIMENSION I : UNIVERSALITY AND REDUCTION OF AMBIENT SPACE

YOUNG WOO NAM

Abstract. Period doubling Hénon renormalization of strongly dissipative maps is generalized in arbitrary finite dimension. In particular, a small perturbation of toy model maps with dominated splitting has invariant C^r surfaces embedded in higher dimension and the Cantor attractor has unbounded geometry with respect to full Lebesgue measure on the parameter space. It is an extension of dynamical properties of three dimensional infinitely renormalizable Hénon-like map in arbitrary finite dimension.

1. Introduction

Universality of one dimensional dynamical system was discovered by Feigenbaum and independently by Coullet and Tresser in the mid 1970's. Moreover, the universality of the higher dimensional maps is conjectured by Coullet and Tresser in [CT]. The similar universality properties are expected in higher dimensional maps which are strongly dissipative and close to the one dimensional maps. In particular, renormalizable maps with *period doubling type* are interesting in higher dimension. Universality of two dimensional strongly dissipative infinitely renormalizable Hénon-like maps was introduced in [CLM]. The Cantor attractor of Hénon-like map is the counterpart of that of one dimensional maps but it has typically unbounded geometry. The same geometric properties are common in certain classes of the sectionally dissipative three dimensional Hénon-like family in [Nam1, Nam2, Nam3]. There exists the universal expression of Jacobian determinant of infinitely renormalizable three

Date: February 4, 2015.

dimensional Hénon-like maps but it does not imply the universal expression. However, *unbounded geometry* of Cantor attractor were generalized in the special invariant subspace of infinitely renormalizable maps in [Nam1, Nam3].

This paper is about the generalization of Hénon renormalization in arbitrary finite dimension. In the viewpoint of a perturbation of one dimensional map in higher dimension, Higher dimensional renormalizable Hénon-like map is a counterpart of the perturbation of Misiurewicz maps in higher dimension which appear in [WY].[1] A certain invariant class of infinitely renormalizable three dimensional maps is generalized and every results in [Nam1, Nam3] are extended in arbitrary dimension. For instance, the following results are extended in arbitrary dimension.

- — Universality of Jacobian determinant of renormalized maps.
- — Existence of single invariant surfaces under certain conditions.
- — Existence of C^r renormalizable two dimensonal Hénon-like map with invariant C^r surface.
- — Unbounded geometry of Cantor attractor.

Hénon-like map F from the hypercube B to $\mathbb{R}^{m+2}$ is defined as follows

$$F\colon (x,y,\mathbf{z}) \mapsto (f(x)-\varepsilon(x,y,\mathbf{z}),\ x,\ \boldsymbol{\delta}(x,y,\mathbf{z}))$$

where $f(x)$ is a unimodal map, $\mathbf{z}=(z_1,z_2,\ldots,z_m)$ and $\boldsymbol{\delta}=(\delta^1,\delta^2,\ldots,\delta^m)$ is a map from $B \Subset \mathbb{R}^{m+2}$ to $\mathbb{R}^m$. Let us assume that F has two hyperbolic fixed points, β_0 which has positive eigenvalues and β_1 which has both positive and negative eigenvalues. In this paper, we assume that both $\|\varepsilon\|$ and $\|\boldsymbol{\delta}\|$ are bounded above by $O(\bar{\varepsilon})$ where $\bar{\varepsilon}$ is a small enough positive number. Since $\|\boldsymbol{\delta}\|$ is sufficiently small, each fixed point has only one expanding direction. We assume that the product of any two different eigenvalues is strictly less than one at fixed points of F, namely, *sectionally dissipative* at fixed points. Hénon-like map is called *renormalizable* if $W^u(\beta_0)$ intersects $W^s(\beta_1)$ at the orbit of a single point. Thus F has one dimensional unstable manifold and codimension one stable manifold at fixed points.

Theorem 1.1 (Universality of $\operatorname{Jac} R^nF$)**.** *Let F be the $m+2$ dimensional infinitely renormalizable Hénon-like map. Then*

$$\operatorname{Jac} R^nF = b^{2^n} a(x)(1+O(\rho^n))$$

where $b=b_F$ is the average Jacobian of F, $a(x)$ is the universal function for $\rho \in (0,1)$.

Let the Hénon-like map with the condition $\partial_{z_j}\varepsilon \equiv 0$ for all $1 \le j \le m$ be the *toy model map*, say F_{mod} as follows

$$F_{\text{mod}}(x,y,\mathbf{z}) = (f(x)-\varepsilon(x,y),\ x,\ \boldsymbol{\delta}(x,y,\mathbf{z})).$$

If F_{mod} is infinitely renormalizable, then n^{th} renormalization of F_{mod} contains two dimensional renormalized map with universality

$$\pi_{xy} \circ R^nF_{\text{mod}}(x,y,\mathbf{z}) = R^nF_{2d}(x,y) = (f_n(x) + b_1^{2^n} a(x)\, y\,(1+O(\rho^n)),\ x)$$

---

[1] The claim for counterpart might require renormalizable higher dimensional Hénon-like map has *rank one* attractor. Renormalizable two dimensonal Hénon-like maps have one dimensional global attracting set in [LM] and by slight modifying proof can show that it is true for higher dimensional Hénon-like maps. But we would not deal with this fact in this paper.

where b_1 is the average Jacobian of the two dimensional Hénon-like map for some $0 < \rho < 1$. If $\|\boldsymbol{\delta}\| \ll b_1$, then there exists the continuous invariant plane field over the critical Cantor set under the DF_{mod}. Moreover, F is a *small perturbation of the model map*, that is, $\varepsilon(x, y, \mathbf{z}) = \varepsilon_{2d}(x, y) + \widetilde{\varepsilon}(x, y, \mathbf{z})$ and $\max\{ \, \|\partial_{z_j} \varepsilon\| \mid 1 \leq j \leq m \,\}$, then it also has continuous invariant plane field. Furthermore, there exists a single surface Q invariant under F. Additionally if F is infinitely renormalizable, then there exists an invariant surface Q_n under $R^n F$ for each $n \in \mathbb{N}$ as the graph of C^r map $\boldsymbol{\xi} = (\xi^1, \xi^2, \ldots, \xi^m)$ from $xy-$plane to z_j-axis for all $1 \leq j \leq m$ for $2 \leq r < \infty$(Lemma 7.6). Then two dimensional C^r Hénon-like map is defined as follows

$$F_{2d,\,\boldsymbol{\xi}}(x, y) = (f(x) - \varepsilon(x, y, \boldsymbol{\xi}),\ x) \tag{1.1}$$

where $Q \equiv \operatorname{graph}(\boldsymbol{\xi})$ is a C^r invariant surface under F. Then universality theorem of infinitely renormalizable C^r Hénon-like maps are obtained.

Theorem 1.2 (Universality of C^r Hénon-like maps with invariant single surfaces for $2 \leq r < \infty$)**.** *Let Hénon-like map $F_{2d,\,\boldsymbol{\xi}}$ be the C^r map for some $2 \leq r < \infty$ which is defined in* (1.1). *Suppose that $F_{2d,\,\boldsymbol{\xi}}$ is infinitely renormalizable. Then*

$$R^n F_{2d,\,\boldsymbol{\xi}} = (f_n(x) - b_{1,\,2d}^{2^n}\, a(x)\, y(1 + O(\rho^n)),\ x)$$

where $b_{1,\,2d}$ is the average Jacobian of $F_{2d,\,\boldsymbol{\xi}}$ and $a(x)$ is the universal function for some $0 < \rho < 1$.

Cantor attractor of C^r Hénon-like map also has the geometric properties which are the same as that of Cantor attractor for analytic maps. In particular, the critical Cantor set has unbounded geometry (Theorem 9.2). Moreover, all of these dynamical properties of Cantor attractor are generalized in higher dimensional Hénon-like map F through its invariant surfaces.

1.1. Notations.

For the given map F, we denote the set A is related to F to be $A(F)$ or A_F. F can be omitted if there is no confusion without F. The domain of the function F is denoted to $\operatorname{Dom}(F)$ and the image of the set B under a function F is denoted to be $\operatorname{Im}(F)$. $F|_A$ is called the restriction F on A where $A \subset \operatorname{Dom}(F)$. If $F(B) \subset B$, then we call B is an (forward) invariant set under F.

Let the projection from $\mathbb{R}^{m+2}$ to its $x-$axis, $y-$axis and $z-$axis be π_x, π_y and π_z respectively. Moreover, let the projection from $\mathbb{R}^3$ to $xy-$plane be π_{xy} and so on. The derivative of the map f is expressed as Df. The chain rule implies that $D(f \circ g)(w) = Df \circ g(w) \cdot Dg(w)$. In this paper, the boldfaced letter means the condensed expression with m coordinates. For example,

$$\mathbf{z} = (z_1, z_2, \ldots, z_m), \quad \boldsymbol{\delta} = (\delta^1, \delta^2, \ldots, \delta^m) \text{ and } \boldsymbol{\xi} = (\xi^1, \xi^2, \ldots, \xi^m).$$

The dot product of two objects presented boldfaced letters, say $\mathbf{A}$ and $\mathbf{B}$ means the inner product of them. Denote it by $\mathbf{A} \cdot \mathbf{B}$. Let the set distance $\operatorname{dist}_{\min}(R, S)$ be the minimal distance between two sets, R and S

$$\operatorname{dist}_{\min}(R, S) = \inf \{ \ \operatorname{dist}(r, s) \text{ for all } r \in R \text{ and } s \in S \ \} .$$

Denote the set of periodic points of F to be Per_F. The orbit of the point w under the map f is denoted to be $\operatorname{Orb}(w, f)$. Denote the (complete) orbit of w to be $\operatorname{Orb}(w)$ unless the map is emphasized or is ambiguous on the context in the related description. $A = O(B)$ means that there exists a positive number C such that $A \leq CB$. Moreover, $A \asymp B$ means that there exists a positive number C which satisfies $\dfrac{1}{C}B \leq A \leq CB$.

2. Hénon renormalization in higher dimension

2.1. Hénon-like maps in higher dimension. Let B_{2d} be the domain of two dimensional Hénon-like map and it is the square region with the center origin. Let B be the box domain which is a thickened domain of two dimensional Hénon-like map, that is, $B = B_{2d} \times [-c, c]^m$ for some $c > 0$ and a fixed positive number m. Let us define the $m+2$ *dimensional Hénon-like map* on the hypercube B as follows

$$F(x, y, \mathbf{z}) = (f(x) - \varepsilon(x, y, \mathbf{z}),\ x,\ \boldsymbol{\delta}(x, y, \mathbf{z})) \tag{2.1}$$

where $f : I^x \rightarrow I^x$ is a unimodal map, $\mathbf{z}$ is $(z_1, z_2, \ldots, z_m)$ and $\boldsymbol{\delta} = (\delta^1, \delta^2, \ldots, \delta^m)$ is the map from B to $\mathbb{R}^m$. For simplicity, let us assume that the length of each side of B is same. Denote the domain, $B = I^x \times \mathbf{I}^v$ where I^x is the line parallel to x-axis and $\mathbf{I}^v = I^y \times I^{\mathbf{z}}$ where I^y is the line parallel to y-axis and $I^{\mathbf{z}}$ is the hypercube $[-c, c]^m$.

Remark 2.1. On the following sections, some objects defined on the two dimensional space has the subscript $2d$. For example, B_{2d} is the square domain of the two dimensional Hénon-like map and F_{2d} is the two dimensional Hénon-like map defined on B_{2d}. However, same notation without any index indicates the $m+2$ dimensional object. For instance, F and B are the higher dimensional Hénon-like map and its box domain respectively.

Observe that the image of the codimension one hyperplane, $\{x = C\}$ under F is contained in the codimension one hyperplane, $\{y = C\}$.

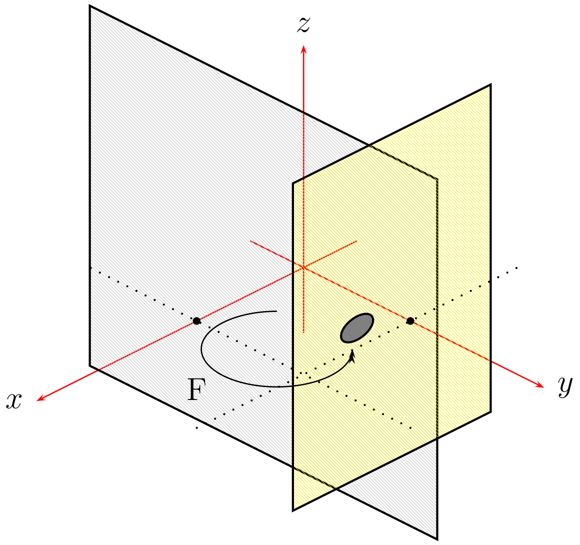

FIGURE 2.1. Image of $\{x = const.\}$ under higher dimensional Hénon-like map

In this paper, higher dimensional analytic Hénon-like maps in (2.1) have the following properties.

- — F is orientation preserving map.
- — f has non flat unique critical point in I^x.
- — Both $\|\varepsilon\| \leq \bar{\varepsilon}$ and $\|\boldsymbol{\delta}\| \leq \bar{\delta}$ with sufficiently small positive numbers $\bar{\varepsilon}$ and $\bar{\delta}$.
- — F has only two fixed points one of which, say β_0, has only positive eigenvalues.
- — F is *sectionally dissipative* at fixed points, that is, any product of two eigenvalues of each fixed point has the absolute value strictly less than one.
- — The fixed points, β_0 and β_1 have codimension one stable manifold and one dimensional unstable manifold.

The orientation preserving higher dimensional Hénon-like map is called *renormalizable* if $W^u(\beta_0)$ and $W^s(\beta_1)$ intersects in the single orbit of a point. Observe that *sectional dissipativeness* imply that each fixed point has condimension one stable manifold and one dimensional unstable manifold.

Let $p_0 \in \mathrm{Orb}_{\mathbb{Z}}(w)$ be the point which is farthest point from β_1 along the component of $W^s_{\mathrm{loc}}(\beta_1)$ which contains β_1. Let $p_k = F^k(p_0)$ for each $k \in \mathbb{Z}$. Then p_0 and the forward orbit of p_0 are on $W^s_{\mathrm{loc}}(\beta_1)$. The local stable manifold of p_{-n}, $W^s_{\mathrm{loc}}(p_{-n})$ where $n \leq 0$ is pairwise disjoint component of $W^s(\beta_1)$ and $W^s_{\mathrm{loc}}(p_{-n})$ converges to $W^s(\beta_1)$ because p_{-n} converges to β_0 as $n \to +\infty$. Let M_{-n} be the connected component of $W^s(\beta_1)$ which contains p_{-n}, say $W^s_{\mathrm{loc}}(p_{-n})$, to be for every $n \geq 0$. For instance, M_0 denotes $W^s_{\mathrm{loc}}(\beta_1)$. Moreover, we can define M_1 as the component of $W^s(\beta_1)$ whose image under F is contained in M_{-1} such that it does not have any point of $\mathrm{Orb}_{\mathbb{Z}}(w)$. M_1 is on the opposite side of M_{-1} from M_0. We may assume that M_1 is a curve connecting the up and down sides of the square domain B inside. Then we can easily check the curves $[p_0, p_1]^u_{\beta_0}$ and $[p_1, p_2]^u_{\beta_0}$ which are parts of $W^u(\beta_0)$ does not intersect M_1 and M_{-1} respectively when F is renormalizable.

2.2. Renormalization of $m+2$ dimensional Hénon-like maps.

The analytic definition of period doubling renormalization of Hénon-like map requires conjugation which is not just dilation because F^2 is not Hénon-like map, that is, the image of the hyperplane, $\{x = C\}$ in B under F^2 is not the part of the hyperplane, $\{y = C\}$. Thus we need non-linear coordinate change map for renormalization. Define the *horizontal-like diffeomorphism* as follows

$$H(x, y, z) = (f(x) - \varepsilon(x, y, \mathbf{z}),\ y,\ \mathbf{z} - \boldsymbol{\delta}(y, f^{-1}(y), \mathbf{0})). \tag{2.2}$$

The inverse of H, H^{-1} is as follows

$$H^{-1}(x, y, \mathbf{z}) \equiv (\phi^{-1}(w),\ y,\ \mathbf{z} + \boldsymbol{\delta}(y,\ f^{-1}(y),\ \mathbf{0}))$$

where ϕ^{-1} is the straightening map satisfying $\phi^{-1} \circ H(w) = x$ for $w = (x, y, \mathbf{z})$.

Let us define $\mathrm{Dom}(H)$ as the region enclosed by hypersurfaces, $\{f(x) - \varepsilon(x, y, \mathbf{z}) = \text{const.}\}$, $\{y = \text{const.}\}$ and $\{z_j = \text{const.}\}$ for $1 \leq j \leq m$ such that the image of this region under H is $V \times \mathbf{I}^v$. Let $\mathcal{U}_U$ be the space of unimodal maps defined on the set U.

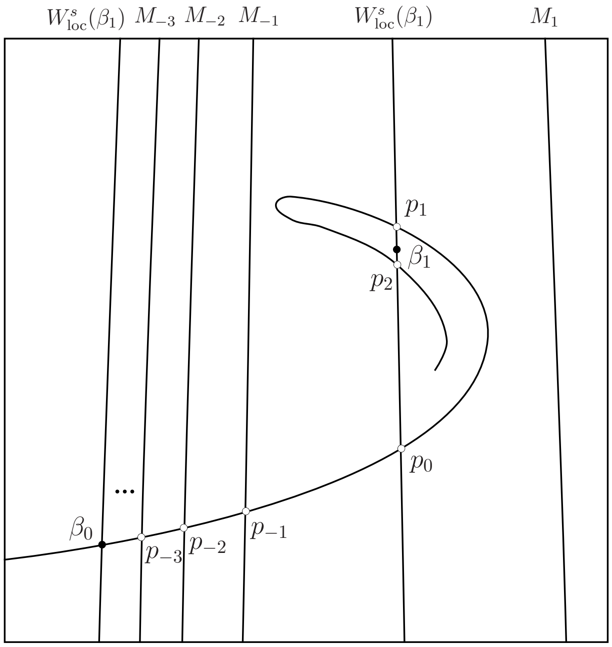

FIGURE 2.2. Stable and unstable manifolds at fixed points

Proposition 2.1. *Let $F(w) = (f(x) - \varepsilon(w),\ x,\ \boldsymbol{\delta}(w))$ be a higher dimensional Hénon-like map and H be the horizontal-like diffeomorphism defined in (2.2) where $\|\varepsilon\| \le \bar{\varepsilon}$ and $\|\boldsymbol{\delta}\| \le \bar{\delta}$ with small enough positive numbers $\bar{\varepsilon}$ and $\bar{\delta}$. Suppose that the unimodal map f is renormalizable. Then there exists a unimodal map $f_1 \in \mathcal{U}_V$ such that $\|f_1 - f^2\|_V < C\bar{\varepsilon}$ and the map $H \circ F^2 \circ H^{-1}$ is the Hénon-like map $(x, y, z) \mapsto (f_1(x) - \varepsilon_1(x, y, \mathbf{z}),\ x,\ \boldsymbol{\delta}_1(x, y, \mathbf{z}))$ with the norm, $\|\varepsilon_1\| = O(\bar{\varepsilon}^2 + \bar{\varepsilon}\bar{\delta})$ and $\|\boldsymbol{\delta}_1\| = O(\bar{\varepsilon}\bar{\delta} + \bar{\delta}^2)$.*

Proof. By the straightforward calculation, $H \circ F^2 \circ H^{-1}$ is

$$(f(f(x) - \varepsilon \circ F \circ H^{-1}(w)) - \varepsilon \circ F^2 \circ H^{-1}(w), \quad x, \quad \boldsymbol{\delta} \circ F \circ H^{-1}(w) - \boldsymbol{\delta}(x, f^{-1}(x), \mathbf{0}))$$

Thus the first coordinate function of $H \circ F^2 \circ H^{-1}$ is

$$f(f(x) - \varepsilon \circ F \circ H^{-1}(w)) - \varepsilon \circ F^2 \circ H^{-1}(w).$$

By the linear appoximation, we obtain the estimation of first coordinate function.

$$\begin{aligned}
&f(f(x)) - \varepsilon \circ F \circ H^{-1}(w)) - \varepsilon \circ F^2 \circ H^{-1}(w) \\
&= f^2(x) - f'(f(x)) \cdot \varepsilon \circ F \circ H^{-1}(w) - \big[\, \varepsilon(f(x),\, x,\, \mathbf{0}) + \partial_x \varepsilon \circ (f(x),\, x,\, \mathbf{0}) \cdot \varepsilon \circ F \circ H^{-1}(w) \\
&\qquad + \sum_{j=1}^{m} \partial_{z_j} \varepsilon \circ (f(x),\, x,\, \mathbf{0}) \cdot \delta^j \circ F \circ H^{-1}(w) \,\big] + h.\,o.\,t. \\
&= f^2(x) - v \circ f(x) - [\, f'(f(x)) - \partial_x \varepsilon \circ (f(x),\, x,\, \mathbf{0}) \,] \cdot v(x) \\
&\qquad - [\, f'(f(x)) - \partial_x \varepsilon \circ (f(x),\, x,\, \mathbf{0}) \,] \cdot \Big[\, \partial_y \varepsilon \circ (x, f^{-1}(x), \mathbf{0}) \cdot (f^{-1})'(x) \cdot \varepsilon \circ H^{-1}(w)
\end{aligned}$$

$$
\begin{aligned}
&\qquad + \sum_{j=1}^{m} \partial_{z_j}\varepsilon \circ (x, f^{-1}(x), \mathbf{0}) \cdot \delta^j \circ H^{-1}(w) \Big] \\
&\quad - \sum_{j=1}^{m} \partial_{z_j}\varepsilon \circ (f(x),\, x,\, \mathbf{0}) \cdot \delta^j \circ F \circ H^{-1}(w) + h.\,o.\,t.
\end{aligned}
$$

Let $v(x) = \varepsilon(x,\, f^{-1}(x),\, \mathbf{0})$. Then the unimodal map, $f_1(x)$ of the first component of $H \circ F^2 \circ H^{-1}$ is the following

$$f^2(x) - v \circ f(x) - \big[\, f'(f(x)) - \partial_x \varepsilon \circ (f(x),\, x,\, \mathbf{0}) \,\big] \cdot v(x).$$

Thus $\| f_1(x) - f^2(x) \| = O(\|\varepsilon\|)$. Moreover, the norm of $\varepsilon_1(w)$ is $O\big(\|\varepsilon\|^2 + \|\varepsilon\|\,\|\boldsymbol{\delta}\|\big)$. Let us estimate the the from third to $(m+2)^{th}$ coordinate maps of $H \circ F^2 \circ H^{-1}$. Recall $\boldsymbol{\delta}_1(w) = \boldsymbol{\delta} \circ F \circ H^{-1}(w) - \boldsymbol{\delta}(x,\, f^{-1}(x),\, \mathbf{0})$. The estimation of each coordinate map of $\boldsymbol{\delta}_1$ is

$$
\begin{aligned}
&\delta^i \circ F \circ H^{-1}(w) - \delta^i(x,\, f^{-1}(x),\, \mathbf{0}) \\
&= \delta^i\big(x,\, \phi^{-1}(w),\, \boldsymbol{\delta} \circ H^{-1}(w)\big) - \delta^i(x,\, f^{-1}(x),\, \mathbf{0}) \\
&= \partial_y \delta^i \circ (x,\, f^{-1}(x),\, \mathbf{0}) \cdot (\phi^{-1}(w) - f^{-1}(x)) + \sum_{j=1}^{m} \partial_{z_j}\delta^i \circ (x,\, f^{-1}(x),\, \mathbf{0}) \cdot \delta^j \circ H^{-1}(w) + h.\,o.\,t. \\
&= \partial_y \delta^i \circ (x,\, f^{-1}(x),\, \mathbf{0}) \cdot (f^{-1})'(x) \cdot \varepsilon \circ H^{-1}(w) \\
&\qquad + \sum_{j=1}^{m} \partial_{z_j}\delta^i \circ (x,\, f^{-1}(x),\, \mathbf{0}) \cdot \delta^j \circ H^{-1}(w) + h.\,o.\,t.
\end{aligned}
$$

for $1 \leq i \leq m$. Then $\|\delta^i_1\|$ is $O(\|\varepsilon\|\,\|\boldsymbol{\delta}\| + \|\boldsymbol{\delta}\|^2)$ for all $1 \leq i \leq m$. Hence, $\|\boldsymbol{\delta}_1\|$ is also $O(\|\varepsilon\|\,\|\boldsymbol{\delta}\| + \|\boldsymbol{\delta}\|^2)$.

□

Define *pre-renormalization* of F as $PRF \equiv H \circ F^2 \circ H^{-1}$ on $H(B^1_v)$. Define $H(B^1_v)$ as Dom(PRF) unless any other statements are specified. Since $H(B^1_v)$ is the hypercube, domain B is recovered as the image of $H(B^1_v)$ under the appropriate linear expanding map $\Lambda(x, y, \mathbf{z}) = (sx, sy, s\mathbf{z})$ for some $s < -1$. Thus we see that Dom(PRF) is $\Lambda^{-1}(B)$.

Definition 2.1 (Renormalization)**.** Let V be the (minimal) closed subinterval of I^x such that $V \times \mathbf{I}^v$ is invariant under $H \circ F^2 \circ H^{-1}$ and let $s\colon V \to I$ be the orientation reversing affine rescaling. With the rescaling map $\Lambda(x, y, \mathbf{z}) = (sx, sy, s\mathbf{z})$, The *renormalization* of the $m+2$ dimensional Hénon-like map is defined as $\Lambda \circ H \circ F^2 \circ H^{-1} \circ \Lambda^{-1}$ on the domain $B \equiv I^x \times \mathbf{I}^\mathbf{v}$

$$RF = \Lambda \circ H \circ F^2 \circ H^{-1} \circ \Lambda^{-1}.$$

If RF is also renormalizable, we can define the second renormalization of F as the renormalization of RF. Then if F is n times renormalizable, then the n^{th} renormalization is defined successively

$$R^n F = \Lambda_{n-1} \circ H_{n-1} \circ (R^{n-1}F)^2 \circ H^{-1}_{n-1} \circ \Lambda^{-1}_{n-1}.$$

where $R^{n-1}F$ is the $(n-1)^{th}$th renormalization of F for $n \geq 1$.

Let the set of infinitely renormalizable higher dimensional Hénon-like map be $\mathcal{I}(\bar{\varepsilon})$ where $\max\{\ \|\varepsilon\|,\ \|\boldsymbol{\delta}\|\ \} \le \bar{\varepsilon}$ for small enough positive number $\bar{\varepsilon}$. We call the higher dimensional Hénon-like map just Hénon-like map unless it makes any confusion in the following sections.

3. Critical Cantor set

The minimal attracting set for two dimensional infinitely renormalizable Hénon-like map F is the Cantor set on which F acts as the dyadic adding machine. The topological construction of the invariant Cantor set of higher dimensional Hénon-like map is exactly same as that of two-dimensional Hénon-like map (Corollary **??** below). Thus we use the same definitions and notions of the two dimensional case in this section.

Denote Ψ^1_v by $\psi^1_v \equiv H^{-1} \circ \Lambda^{-1}$. Thus it is the non-linear scaling map which conjugates F^2 to RF on $\Psi^1_v(B)$. Denote Ψ^1_c by $\psi^1_c \equiv F \circ \psi_v$. The subscript v and c are associated to the maps with the *critical value* and the *critical point* respectively. Similarly, let ψ^2_v and ψ^2_c be the non linear scaling maps conjugating RF to R^2F. Let

$$\Psi^2_{vv} = \psi^1_v \circ \psi^2_v, \quad \Psi^2_{cv} = \psi^1_c \circ \psi^2_v, \quad \Psi^2_{vc} = \psi^1_v \circ \psi^2_c, \ldots$$

and so on. Successively we can define the non-linear scaling map of the n^{th} level for any $n \in \mathbb{N}$ as follows

$$\Psi^n_{\mathbf{w}} = \psi^1_{w_1} \circ \cdots \circ \psi^n_{w_n}, \quad \mathbf{w} = (w_1, \ldots, w_n) \in \{v, c\}^n$$

where $\mathbf{w} = (w_1, \ldots, w_n)$ is the word of length n and $W^n = \{v, c\}^n$ is the n-fold Cartesian product of $\{v, c\}$.

Lemma 3.1. *Let the Hénon-like map, F be in $\mathcal{I}(\bar{\varepsilon})$. Then the derivative of the map $\Psi^n_{\mathbf{w}}$ is exponentially shrinking for $n \in \mathbb{N}$ with σ, that is, $\|D\Psi^n_{\mathbf{w}}\| \le C\sigma^n$ for every words $\mathbf{w} \in W^n$ where $C > 0$ depends only on B and $\bar{\varepsilon}$.*

Proof. The identical equation $H \circ H^{-1} = \text{id}$ implies that [2]

$$f \circ \phi^{-1}(w) - \varepsilon \circ H^{-1}(w) = x.$$

Thus we have $\phi^{-1}(w) = f^{-1}(x + \varepsilon \circ H(w))$. Recall that

$$\varepsilon \circ H^{-1}(w) = \varepsilon(\phi^{-1}(w),\ y,\ z + \delta(y, f^{-1}(y), \mathbf{0})).$$

Then by the chain rule, each partial derivatives of ϕ^{-1} is as follows

---

[2] The first coordinate map of $H^{-1}(w)$, $\phi^{-1}(x, y, z)$ is *not* the *inverse function* of the some function $\phi(w)$. However, $\phi^{-1}(w)$ is a $\varepsilon-$perturbation of $f^{-1}(x)$ as follows

$$f \circ \phi^{-1}(w) - \varepsilon \circ H^{-1}(w) = x.$$

$$\begin{aligned}
\partial_x \phi^{-1}(w) =&\ (f^{-1})'(x + \varepsilon \circ H^{-1}(w)) \cdot \big[\, 1 + \partial_x \varepsilon \circ H^{-1}(w) \cdot \partial_x \phi^{-1}(w) \,\big] \\
\partial_y \phi^{-1}(w) =&\ (f^{-1})'(x + \varepsilon \circ H^{-1}(w)) \cdot \Big[\, \partial_x \varepsilon \circ H^{-1}(w) \cdot \partial_y \phi^{-1}(w) + \partial_y \varepsilon \circ H^{-1}(w) \\
&\qquad + \sum_{j=1}^{m} \partial_{z_j} \varepsilon \circ H^{-1}(w) \cdot \frac{d}{dy}\, \delta(y, f^{-1}(y), \mathbf{0}) \,\Big] \\
\partial_{z_i} \phi^{-1}(w) =&\ (f^{-1})'(x + \varepsilon \circ H^{-1}(w)) \cdot \big[\, \partial_x \varepsilon \circ H^{-1}(w) \cdot \partial_{z_i} \phi^{-1}(w) + \partial_{z_i} \varepsilon \circ H^{-1}(w) \,\big].
\end{aligned}$$

for $1 \leq i \leq m$. Then

$$\begin{aligned}
\partial_x \phi^{-1}(w) =&\ \frac{(f^{-1})'(x + \varepsilon \circ H^{-1}(w))}{1 - (f^{-1})'(x + \varepsilon \circ H^{-1}(w)) \cdot \partial_x \varepsilon \circ H^{-1}(w)} \\
\partial_y \phi^{-1}(w) =&\ \partial_x \phi^{-1}(w) \cdot \Big[\, \partial_y \varepsilon \circ H^{-1}(w) + \sum_{j=1}^{m} \partial_{z_j} \varepsilon \circ H^{-1}(w) \cdot \frac{d}{dy}\, \delta^j(y, f^{-1}(y), \mathbf{0}) \,\Big] \\
\partial_{z_i} \phi^{-1}(w) =&\ \partial_x \phi^{-1}(w) \cdot \partial_{z_i} \varepsilon \circ H^{-1}(w).
\end{aligned} \tag{3.1}$$

for $1 \leq i \leq m$. Let us estimate $\| D\phi^{-1} \|$. The above equation (3.1) implies that $\| \partial_x \phi^{-1} \| \asymp \| (f^{-1})' \|$ and furthermore, $\phi^{-1}(x, y_0, \mathbf{z}_0) \asymp f^{-1}(x)$ for every $(y_0, \mathbf{z}_0) \in \mathbf{I}^v$. The fact that $\phi^{-1} \colon \Lambda^{-1}(B) \to \pi_x(B^1_v)$ implies that the domain of f^{-1} is $\pi_x(\Lambda^{-1}(B))$. Then $\| (f^{-1})' \|$ is away from one and $\| \partial_y \phi^{-1} \|$ and $\| \partial_{z_i} \phi^{-1} \|$ are $O(\bar{\varepsilon})$ for $i = 1, 2, \ldots, m$ by the equation (3.1).

The norm of derivatives of $\phi^{-1}_n(w)$ for each n has the same upper bounds because $f_n \to f_*$ exponentially fast and $\| \partial_y \phi^{-1}_n \|$ and $\| \partial_{z_i} \phi^{-1}_n \|$ for $i = 1, 2, \ldots, m$ are bounded by $O(\bar{\varepsilon}^{2^n})$. The dilation, Λ^{-1} contracts by the factor $\sigma(1 + O(\rho^n))$ where $\rho = \operatorname{dist}(F, F_*)$. The above estimations imply that $\| DH^{-1}_n \|$ and $\| D(F \circ H^{-1}_n) \|$ are uniformly bounded and the upper bounds are independent of n. Thus $\| \psi^n_w \| \leq C\sigma$ for $w = v, c$. Hence, the composition of ψ^k_w for $k = 1, 2, \ldots, n$ contracts by the factor $C\sigma^n$, that is, $\| D\Psi_{\mathbf{w}} \| \leq C\sigma^n$ for some $C > 0$.

□

Let $B^1_v \equiv B^1_v(F)$ and $B^1_c \equiv B^1_c(F)$. Thus by the definitions on Section 2.2, $B^1_v(F) = \psi^1_v(B)$ and $B^1_c(F) = F \circ \psi^1_v(B)$. Moreover, $F(B^1_c) \subset B^1_v$. If the Hénon-like map F is n times renormalizable, we can define $B^1_v(R^nF)$ and $B^1_c(R^nF)$ as $\psi^{n+1}_v(B)$ and $F_n \circ \psi^{n+1}_v(B)$ respectively for each $n \geq 1$. We call the regions $B^n_{\mathbf{w}} \equiv B^n_{\mathbf{w}}(F) = \Psi^n_{\mathbf{w}}(B)$ *pieces* of the n^{th} level or n^{th} *generation* where $\mathbf{w} \in W^n$. Moreover, W^n can be a additive group under the following correspondence from W^n to the numbers with base 2 of mod 2^n

$$\mathbf{w} \mapsto \sum_{k=0}^{n-1} w_{k+1} 2^k \qquad (\operatorname{mod} 2^n)$$

where the symbols v and c are corresponding to 0 and 1 respectively.

Corollary 3.2. *The diameter of each piece shrinks exponentially fast for each $n \geq 1$, that is,* $\operatorname{diam}(B^n_{\mathbf{w}}) \leq C\sigma^n$ *for all $\mathbf{w} \in W^n$ where the constant $C > 0$ depends only on B and $\bar{\varepsilon}$.*

The construction of the critical Cantor set for higher dimensional Hénon-like map in $\mathcal{I}(\bar{\varepsilon})$ is the same as that of two dimensional Hénon-like map. See Section 5 in [CLM]. Define the critical Cantor set of the infinitely renormalizable Hénon-like map F as follows

$$\mathcal{O} \equiv \mathcal{O}_F = \bigcap_{n=1}^{\infty} \bigcup_{\mathbf{w} \in W^n} B^n_{\mathbf{w}}.$$

Infinitely renormalizable Hénon-like map, F acts as the dyadic adding machine on the above invariant Cantor set. For detailed construction of the dyadic group as Cantor set, see [**?**].

4. Average Jacobian

Let us consider the average Jacobian of the infinitely renormalizable map F. The definition and properties of average Jacobian of higher dimensional Hénon-like maps is the same as those of two dimensional ones. For the sake of completeness, we describe Lemma and Theorem in this section below. Let the Jacobian determinant of F at w be $\operatorname{Jac} F(w)$. Thus

$$\log \left| \frac{\operatorname{Jac} F(y)}{\operatorname{Jac} F(z)} \right| \leq C \quad \text{for any} \ \ y, z \in B$$

by some constant C which is not depending on y or z. The diameter of the domain $B^n_{\mathbf{w}}$ converges to zero exponentially fast by Lemma 3.1. It implies the following lemma.

Lemma 4.1 (Distortion Lemma)**.** *There exist a constant C and the positive number $\rho < 1$ satisfying the following estimate*

$$\log \left| \frac{\operatorname{Jac} F^k(y)}{\operatorname{Jac} F^k(z)} \right| \leq C\rho^n \quad \textit{for any} \ \ y, z \in B^n_{\mathbf{w}}$$

where $k = 1, 2, 2^2, \ldots, 2^n$.

Existence of the unique invariant probability measure, say μ, on $\mathcal{O}_F$ enable us to define the average Jacobian.

$$b_F \equiv b = \exp \int_{\mathcal{O}_F} \log \operatorname{Jac} F \, d\mu \,.$$

On each level n, the measure μ on $\mathcal{O}_F$ satisfies that $\mu(B^n_{\mathbf{w}_n} \cap \mathcal{O}_F) = 1/2^n$ for every word $\mathbf{w}_n$ of length n.

Corollary 4.2. *For any piece of $B^n_{\mathbf{w}}$ on the level n and any point $w \in B^n_{\mathbf{w}}$,*

$$\operatorname{Jac} F^{2^n}(w) = b^{2^n}(1 + O(\rho^n))$$

where b is the average Jacobian of F for some positive $\rho < 1$.

Proof. Since

$$\int_{B^n_{\mathbf{w}}} \log \operatorname{Jac} F^{2^n} d\mu = \int_{\mathcal{O}} \log \operatorname{Jac} F \, d\mu = \log b,$$

there exists a point $\eta \in B^n_{\mathbf{w}}$ such that $\log \operatorname{Jac} F^{2^n}(\eta) = \dfrac{\log b}{\mu(B^n_{\mathbf{w}})} = 2^n \log b$

For any $w \in B^n_{\mathbf{w}}$, $\log \operatorname{Jac} F^{2^n}(z) \leq C\rho^n + \log \operatorname{Jac} F^{2^n}(\eta)$, and $O(\rho^n) = \log(1 + O(\rho^n))$ for a fixed constant ρ. Then

$$\log \operatorname{Jac} F^{2^n}(w) = \log(1 + O(\rho^n)) + \log \operatorname{Jac} F^{2^n}(\eta)$$

$$= \log\left[(1 + O(\rho^n)) \cdot b^{2^n}\right]$$

Hence, $\operatorname{Jac} F^{2^n}(w) = b^{2^n}(1 + O(\rho^n))$. $\square$

Since F is the $m+2$ dimensional map, it has Lyapunov exponents $\chi_0, \chi_1, \ldots, \chi_{m+2}$. Let χ_0 be the maximal one. Since F is ergodic with respect to the invariant finite measure μ on the critical Cantor set, we get the following inequality for any Lyapunov exponent χ

$$|\mu|\, \chi(x) \leq \int_{\mathcal{O}_F} \log \|DF(x)\|\, d\mu(x)$$

where $|\mu|$ is the total mass of μ on $\mathcal{O}_F$.

Theorem 4.3. *The maximal Lyapunov exponent of F on $\mathcal{O}_F$ is 0.*

Proof. Let μ_n be $2^n\mu|_{B^n_w}$, an invariant measure under F^{2^n} and let ν_n be the (unique) invariant measure on $R^nF|_{\mathcal{O}_{R^nF}}$. Then

$$2^n\chi_0(F,\mu) = \chi_0(F^{2^n}|_{B^n_{v^n}}, \mu_n) = \chi_0(R^nF, \nu_n) \leq \int_{B^n_w} \log \|D(R^nF)\|\, d\nu_n \leq C$$

for every $n \in \mathbb{N}$, where C is a constant independent of n. The last inequality comes from the uniformly bounded C^1 norm of derivative of R^nF. Then the maximal Lyapunov exponent $\chi_0 \leq 0$. If $\chi_0 < 0$, then the support of μ contains some periodic cycles by Pesin's theory. But $\mathcal{O}_F$ does not contain any periodic cycle because F acts on $\mathcal{O}_F$ as a dyadic adding machine. Hence, $\chi_0 = 0$. $\square$

5. Universal expression of Jacobian determinant

The universality of average Jacobian is involved with the asymptotic behavior of the non linear scaling map $\Psi^n_{v^n}$ between the renormalized map $F_n \equiv R^nF$ and F^{2^n} for each $n \in \mathbb{N}$. $\Psi^n_{v^n}$ conjugate F^{2^n} to F_n. Thus using chain rule and Corollary 4.2, $\operatorname{Jac} F_n$ is the product of the average Jacobian of F^{2^n} and the ratio of the $\operatorname{Jac}\Psi^n_{v^n}$ at w and $F_n(w)$ as follows

$$\begin{aligned} \operatorname{Jac} F_n(w) &= \operatorname{Jac} F^{2^n}(\Psi^n_{v^n}(w)) \frac{\operatorname{Jac}\Psi^n_{v^n}(w)}{\operatorname{Jac}\Psi^n_{v^n}(F_n(w))} \\ &= b^{2^n} \frac{\operatorname{Jac}\Psi^n_{v^n}(w)}{\operatorname{Jac}\Psi^n_{v^n}(F_n(w))}(1 + O(\rho^n)). \end{aligned} \tag{5.1}$$

Denote the word, v^n by $\mathbf{v}$. Then the universality of Jacobian of $\Psi^n_{v^n}$ implies the universality of $\operatorname{Jac} F_n$ in Theorem 5.10 below. The asymptotic of non-linear part of $\Psi^n_{\mathbf{v}}$ is essential to the universal expression of $\operatorname{Jac}\Psi^n_{\mathbf{v}}$.

5.1. Asymptotic of Ψ^n_k for fixed k^{th} level . For every infinitely renormalizable Hénon-like map F, we have a well defined *tip*

$$\{\tau\} \equiv \{\tau_F\} = \bigcap_{n\geq 0} B^n_{v^n} \tag{5.2}$$

where the pieces $B^n_{v^n}$ are defined as $\Psi^n_{\mathbf{v}}(B(R^nF))$. The tip of the renormalized map, R^kF is denoted by $\tau_k = \tau(R^kF)$ for each $k \in \mathbb{N}$. Since every $B^n_{\mathbf{v}}(F)$ contains τ_F, let us condense the notation $\Psi^n_{\mathbf{v}}$ into Ψ^n_{tip}. Moreover, in order to simplify the notation and calculations, we would let the tip move to the origin as a fixed point of each $\Psi^1_v(R^kF)$ for every $k \in \mathbb{N}$ by conjugation of the appropriate translations. Let us define Ψ^{k+1}_k in this section.[3]

$$\Psi_k(w) \equiv \Psi^{k+1}_k(w) = \Psi^{k+1}_v(w + \tau_{k+1}) - \tau_k \tag{5.3}$$

Let the derivative of the map defined Ψ_k on (5.3) at the origin be $D_k \equiv D^{k+1}_k$.

$$\begin{aligned} D^{k+1}_k \equiv D_k = D\Psi^{k+1}_k(\mathbf{0}) &= D(\Psi^1_v(R^kF))(\tau_{k+1}) \\ &= D(T_k \circ \Psi^1_v(R^kF) \circ T^{-1}_{k+1})(\mathbf{0}) \end{aligned}$$

where $T_j : w \mapsto w - \tau_j$ for $j = k,\, k+1$. Then we can decompose D_k into the matrix of which diagonal entries are 1s and the diagonal matrix as follows

(5.4)

$$\begin{pmatrix} 1 & t_k & u^1_k & \cdots & u^m_k \\ & 1 & & & \\ & d^1_k & 1 & & \\ & \vdots & & \ddots & \\ & d^m_k & & & 1 \end{pmatrix} \begin{pmatrix} \alpha_k & & & & \\ & \sigma_k & & & \\ & & \sigma_k & & \\ & & & \ddots & \\ & & & & \sigma_k \end{pmatrix} = \begin{pmatrix} \alpha_k & \sigma_k t_k & \sigma_k u^1_k & \cdots & \sigma_k u^m_k \\ & \sigma_k & & & \\ & \sigma_k d^1_k & & & \\ & \vdots & & \boxed{\sigma_k \cdot \mathrm{Id}_{m\times m}} & \\ & \sigma_k d^m_k & & & \end{pmatrix}$$

where $\mathrm{Id}_{m\times m}$ is the $m \times m$ identity matrix. We condense the expression of D_k using the boldfaced letters. Let m dimensional vector $(\, d^1_k\; d^2_k \ldots d^m_k \,)^{Tr}$ be $\mathbf{d}_k$ and $(\, u^1_k\; u^2_k \ldots u^m_k \,)$ be $\mathbf{u}_k$ where Tr is the transpose of the matrix. Recall that $\sigma_k = -\sigma\left(1 + O(\rho^k)\right)$. Decompose Ψ^{k+1}_k into the linear and non-linear parts. Then

$$D_k = \begin{pmatrix} 1 & t_k & \mathbf{u}_k \\ & 1 & \\ & \mathbf{d}_k & 1 \end{pmatrix} \begin{pmatrix} \alpha_k & & \\ & \sigma_k & \\ & & \sigma_k \cdot \mathrm{Id}_{m\times m} \end{pmatrix} = \begin{pmatrix} \alpha_k & \sigma_k\, t_k & \sigma_k\, \mathbf{u}_k \\ & \sigma_k & \\ & \sigma_k\, \mathbf{d}_k & \sigma_k \end{pmatrix} \tag{5.5}$$

$$\Psi^{k+1}_k \equiv \Psi_k(w) = D_k \circ (\mathrm{id} + \mathbf{s}_k)(w) \tag{5.6}$$

where $w = (x, y, \mathbf{z})$ and $\mathbf{s}_k(w) = (s_k(w),\ 0,\ r^1_k(y),\ r^2_k(y),\ \ldots, r^m_k(y)) = O(|w|^2)$ near the origin. Denote $(r^1_k(y),\ r^2_k(y),\ \ldots, r^m_k(y))$ by $\mathbf{r}_k$. Comparing the derivative of $H^{-1}_k \circ \Lambda^{-1}_k$ at the tip and D_k and Corollary 3.2, we obtain the following estimations

---

[3] If we need to distinguish the scaling maps, Ψ^n_k around tip from its composition with translations, then we use the notation, $\Psi^n_{k,\,\text{tip}}$

$$\begin{aligned}
t_k &= \partial_y \phi_k^{-1}(\tau_{k+1}) = \partial_x \phi_k^{-1}(\tau_{k+1}) \cdot \Big[\partial_y \varepsilon_k(\tau_k) + \sum_{j=1}^{m} \partial_{z_j} \varepsilon_k(\tau_k) \cdot d_k^j \Big] \\
u_k^i &= \partial_{z_i} \phi_k^{-1}(\tau_{k+1}) = \partial_x \phi_k^{-1}(\tau_{k+1}) \cdot \partial_{z_i} \varepsilon_k(\tau_k) \qquad (5.7) \\
\text{and} \quad d_k^i &= \frac{d}{dy}\, \delta_k^i \left(\pi_y(\tau_{k+1}),\ f_k^{-1}(\pi_y(\tau_{k+1})),\ \mathbf{0} \right)
\end{aligned}$$

where $\phi_k^{-1}(w) = \pi_x \circ H_k^{-1}(w)$ for $1 \le i \le m$. Thus the norm of each element of D_k, $|t_k|$, $\|\mathbf{u}_k\|$ and $\|\mathbf{d}_k\|$ is bounded by $O(\bar{\varepsilon}^{2^k})$. Since $\|\partial_x \phi_k^{-1}\|$ at the tip exponentially converges to σ as $k \to \infty$, $\alpha_k = \sigma^2 \left(1 + O(\rho^k)\right)$ for some $\rho \in (0,1)$.

Lemma 5.1. *Let* s_k *be the function defined on* (5.6). *For each* $k \in \mathbb{N}$,

(1) $|\,\partial_x s_k| = O(1)$, $\quad |\,\partial_y s_k| = O(\bar{\varepsilon}^{2^k})$, $\quad |\,\partial_{z_i} s_k| = O(\bar{\varepsilon}^{2^k})$
(2) $|\,\partial^2_{xx} s_k| = O(1)$, $\quad |\,\partial^2_{xy} s_k| = O(\bar{\varepsilon}^{2^k})$, $\quad |\,\partial^2_{yy} s_k| = O(\bar{\varepsilon}^{2^k})$
(3) $|\,\partial^2_{yz_i} s_k| = O(\bar{\varepsilon}^{2^k})$, $\quad |\,\partial^2_{z_i x} s_k| = O(\bar{\varepsilon}^{2^k})$, $\quad |\,\partial^2_{z_i z_j} s_k| = O(\bar{\varepsilon}^{2^k})$
(4) $\|\,\mathbf{r}_k(y)\| = O(\bar{\varepsilon}^{2^k})$, $\quad \|\,\mathbf{r}_k'(y)\| = O(\bar{\varepsilon}^{2^k})$, $\quad \|\,\mathbf{r}_k''(y)\| = O(\bar{\varepsilon}^{2^k})$

for $1 \le i, j \le m$.

Proof. The map Ψ_k has the two expressions, $D_k \circ (\mathrm{id} + \mathbf{s}_k)(w)$ and $T_k \circ H_k^{-1} \circ \Lambda_k \circ T_{k+1}^{-1}$, that is,

$$\begin{aligned}
\Psi_k &= D_k \circ (\mathrm{id} + \mathbf{s}_k)(w) \\
&= T_k \circ H_k^{-1} \circ \Lambda_k^{-1} \circ T_{k+1}^{-1}(w) = H_k^{-1} \circ \Lambda_k^{-1}(w + \tau_{k+1}) - \tau_k
\end{aligned}$$

Recall that

$$\begin{aligned}
&D_k \circ (\mathrm{id} + \mathbf{s}_k)(w) \\
&= \begin{pmatrix} \alpha_k & \sigma_k t_k & \sigma_k u_k^1 & \cdots & \sigma_k u_k^m \\ & \sigma_k & & & \\ & \sigma_k d_k^1 & & & \\ & \vdots & & \boxed{\sigma_k \cdot \mathrm{Id}_{m \times m}} & \\ & \sigma_k d_k^m & & & \end{pmatrix} \begin{pmatrix} x + s(w) \\ y \\ z_1 + r_k^1(y) \\ \vdots \\ z_m + r_k^m(y) \end{pmatrix} = \begin{pmatrix} \alpha_k & \sigma_k\, t_k & \sigma_k\, \mathbf{u}_k \\ & \sigma_k & \\ & \sigma_k\, \mathbf{d}_k & \sigma_k \end{pmatrix} \begin{pmatrix} x + s(w) \\ y \\ \mathbf{z} + \mathbf{r}_k(y) \end{pmatrix}
\end{aligned}$$

In order to obtain the asymptotic of the non-linear part of Ψ_k, we need to compare the first and z_i coordinates for each $1 \le i \le m$ of above two expressions of Ψ_k. Let $\tau_k = (\tau_k^x, \tau_k^y, \tau_k^{z_1}, \tau_k^{z_2}, \ldots, \tau_k^{z_m}) \equiv (\tau_k^x, \tau_k^y, \tau_k^{\mathbf{z}})$ for each $k \ge 1$. Firstly, let us compare the z_i coordinates of two expression of Ψ_k.

$$\begin{aligned}
\sigma_k (d_k^i y + z_i + r_k^i(y)) &= \pi_{z_i} \big(H_k^{-1} \circ \Lambda_k^{-1}(w + \tau_{k+1}) - \tau_k \big) \\
&= \sigma_k (z_i + \tau_{k+1}^{z_i}) + \delta_k^i \big(\sigma_k (y + \tau_{k+1}^y),\ f_k^{-1}(\sigma_k (y + \tau_{k+1}^y)),\ \mathbf{0} \big) - \tau_k^{z_i}
\end{aligned}$$

Thus we have the following equation

$$\sigma_k r_k^i(y) = -\sigma_k d_k^i y + \delta_k^i \big(\sigma_k (y + \tau_{k+1}^y),\ f_k^{-1}(\sigma_k (y + \tau_{k+1}^y)),\ \mathbf{0} \big) + \sigma_k \tau_{k+1}^{z_i} - \tau_k^{z_i}.$$

Then $|r^i_k(y)| \le C\big(\,|d^i_k y| + \|\,\delta^i_k\|_{C^0}\big)$ for some $C > 0$ and for all $1 \le i \le m$. The domain is bounded and $\|\boldsymbol{\delta}_k\|$ is $O(\bar{\varepsilon}^{2^k})$. Then we obtain $\|\,\mathbf{r}_k(y)\| = O(\bar{\varepsilon}^{2^k})$. Moreover,

$$(r^i_k)'(y) = -d^i_k + \frac{d}{dy}\,\delta^i_k\big(\sigma_k(y+\tau^y_{k+1}),\ f^{-1}_k(\sigma_k(y+\tau^y_{k+1}),\ \mathbf{0}\big)$$

Thus $|\,(r^i_k)'(y)|$ is controlled by $\|\boldsymbol{\delta}\|_{C^1}$ for all $1 \le i \le m$. Similarly, the second derivative $|\,(r^i_k)''(y)|$ is also controlled by $\|\boldsymbol{\delta}\|_{C^2}$ for all $1 \le i \le m$. Then $\|\,\mathbf{r}'_k(y)\| = O(\bar{\varepsilon}^{2^k})$ and $\|\,\mathbf{r}''_k(y)\| = O(\bar{\varepsilon}^{2^k})$.

Secondly, compare first coordinates using (5.4) and (5.6). Thus

$$\alpha_k x + \alpha_k \cdot s_k(w) + \sigma_k t_k y + \sigma_k \mathbf{u}_k \cdot (\mathbf{z} + \mathbf{r}_k(y)) = \phi^{-1}_k(\sigma_k w + \sigma_k \tau_{k+1}) - \pi_x(\tau_k). \tag{5.8}$$

It implies the following equations

$$\begin{aligned} \alpha_k \cdot \partial_x s_k &= \sigma_k \cdot \partial_x \phi^{-1}_k - \alpha_k \\ \alpha_k \cdot \partial_y s_k &= \sigma_k \cdot \partial_y \phi^{-1}_k - \sigma_k t_k - \sigma_k \cdot \mathbf{u}_k \cdot \mathbf{r}'_k(y) \\ \alpha_k \cdot \partial_{z_i} s_k &= \sigma_k \cdot \partial_{z_i} \phi^{-1}_k - \sigma_k u^i_k \end{aligned} \tag{5.9}$$

for $1 \le i \le m$. Then by the equation (3.1) , $\|\,\partial_x \phi^{-1}_k\| = O(1)$, $\|\,\partial_y \phi^{-1}_k\| = O\big(\bar{\varepsilon}^{2^k}\big)$ and $\|\,\partial_{z_i} \phi^{-1}_k\| = O\big(\bar{\varepsilon}^{2^k}\big)$ for all $1 \le i \le m$. By the equation (5.7), $|\,t_k|$ and $\|\mathbf{u}_k\|$ is $O\big(\bar{\varepsilon}^{2^k}\big)$. Hence, $\|\partial_x s_k\| = O(1)$, $\|\partial_y s_k\| = O\big(\bar{\varepsilon}^{2^k}\big)$ and $\|\partial_{z_i} s_k\| = O\big(\bar{\varepsilon}^{2^k}\big)$ for all $1 \le i \le m$. By the above equation (5.9), each second partial derivatives of s_k are comparable with the second partial derivatives of ϕ^{-1}_k over the same variables because $\|\,\mathbf{r}''_k(y)\| = O\big(\bar{\varepsilon}^{2^k}\big)$.

Let us estimate some second partial derivatives of ϕ^{-1}_k. Recall that

$$\begin{aligned} \phi^{-1}_k(w) =&\ f^{-1}_k(x + \varepsilon_k \circ H^{-1}_k(w)) \\ \varepsilon_k \circ H^{-1}_k(w) =&\ \varepsilon_k(\phi^{-1}_k(w),\, y,\, \mathbf{z} + \boldsymbol{\delta}_k(y, f^{-1}(y), \mathbf{0})). \end{aligned}$$

Thus

$$\begin{aligned} \partial_x \phi^{-1}_k(w) =&\ (f^{-1}_k)'(x + \varepsilon_k \circ H^{-1}_k(w)) \cdot \big[\,1 + \partial_x(\varepsilon_k \circ H^{-1}_k(w))\,\big] \\ \partial_x(\varepsilon_k \circ H^{-1}_k(w)) =&\ \partial_x \varepsilon_k \circ H^{-1}_k(w) \cdot \partial_x \phi^{-1}_k(w) \\ \partial_{xx}(\varepsilon_k \circ H^{-1}_k(w)) =&\ \partial_x(\varepsilon_k \circ H^{-1}_k(w)) \cdot \partial_x \phi^{-1}_k(w) + \partial_x \varepsilon_k \circ H^{-1}_k(w) \cdot \partial_{xx} \phi^{-1}_k(w) \\ =&\ \partial_x \varepsilon_k \circ H^{-1}_k(w) \cdot \big[\,\partial_x \phi^{-1}_k(w)\,\big]^2 + \partial_x \varepsilon_k \circ H^{-1}_k(w) \cdot \partial_{xx} \phi^{-1}_k(w). \end{aligned}$$

Moreover, $\|\varepsilon_k\|_{C^2}$ and $\|\boldsymbol{\delta}_k\|_{C^2}$ bounds the norm of every second derivatives of $\|\,\phi^{-1}_k\|$ except $\|\partial_{xx} \phi^{-1}_k\|$. Let us estimate $\partial_{xx} \phi^{-1}_k(w)$

$$\begin{aligned} \partial_{xx} \phi^{-1}_k(w) =&\ (f^{-1}_k)''(x + \varepsilon_k \circ H^{-1}_k(w)) \cdot \big[\,1 + \partial_x(\varepsilon_k \circ H^{-1}_k(w))\,\big] \\ &+ (f^{-1}_k)'(x + \varepsilon_k \circ H^{-1}_k(w)) \cdot \partial_{xx}(\varepsilon_k \circ H^{-1}_k(w)). \end{aligned}$$

Recall that $\|\,\varepsilon_k\|_{C^2}$ and $\|\,\boldsymbol{\delta}_k\|_{C^2}$ are $O\big(\bar{\varepsilon}^{2^k}\big)$. Since both $\|(f^{-1})'\|$ and $\|(f^{-1})''\|$ are $O(1)$, so is $\|\,\partial_{xx} \phi^{-1}_k\|$. Any other second derivative of $\|\,\phi^{-1}_k\|$ is bounded by $O\big(\bar{\varepsilon}^{2^k}\big)$. For example, the following expression of $\partial_{yx} \phi^{-1}_k$

$$\begin{aligned}
&\partial_{yx}\phi_k^{-1}(w) \\
&= \partial_{xx}\phi_k^{-1}(w)\cdot\left[\partial_y\varepsilon_k\circ H_k^{-1}(w)+\sum_{j=1}^m \partial_{z_j}\varepsilon_k\circ H_k^{-1}(w)\cdot\frac{d}{dy}\,\delta_k^j(y,f_k^{-1}(y),\mathbf{0})\right] \\
&\qquad + \partial_x\phi_k^{-1}(w)\cdot\left[\partial_x(\partial_y\varepsilon_k\circ H_k^{-1}(w))+\partial_x\left(\sum_{j=1}^m \partial_{z_j}\varepsilon_k\circ H_k^{-1}(w)\right)\cdot\frac{d}{dy}\,\delta_k(y,f_k^{-1}(y),\mathbf{0})\right]
\end{aligned}$$

implies that $\|\,\partial_{yx}\phi_k^{-1}\|$ is bounded by $O\big(\bar\varepsilon^{2^k}\big)$. The norm estimation of other second partial derivatives of ϕ_k^{-1} is left to the reader. ☐

5.2. Estimation of non linear part of S_k^n. We consider the behavior of the non linear scaling map from k^{th} level to n^{th} level. Let

$$\Psi_k^n = \Psi_k\circ\cdots\circ\Psi_{n-1},\quad B_k^n = \operatorname{Im}\Psi_k^n$$

By Lemma 3.1,

$$\operatorname{diam}(B_k^n) = O(\sigma^{n-k})\qquad \text{for}\quad k<n$$

Then combining Lemma 3.1 and Lemma 5.1, we have the following corollary.

Corollary 5.2. *For all points $w=(x,y,\mathbf{z})\in B_k^n$ and where $k<n$, we have*

$$\begin{gathered}
|\,\partial_x s_k(w)| = O(\sigma^{n-k})\qquad |\,\partial_y s_k(w)| = O\big(\bar\varepsilon^{2^k}\sigma^{n-k}\big)\qquad |\,\partial_z s_k(w)| = O\big(\bar\varepsilon^{2^k}\sigma^{n-k}\big)\\
\|\,\mathbf{r}_k'(y)\| = O\big(\bar\varepsilon^{2^k}\sigma^{n-k}\big)\qquad \|\,\mathbf{r}_k''(y)\| = O\big(\bar\varepsilon^{2^k}\sigma^{n-k}\big)
\end{gathered}$$

Proof. By definition, $s_k(w)$ is quadratic and higher order terms at the tip, τ_k. Similarly, $\mathbf{r}_k'(y)$ only contains quadratic and higher order terms at the tip. Then use Taylor's expansion and upper bounds of $\operatorname{diam}(B_k^n)$ is $O(\sigma^{n-k})$. ☐

Since the origin is the fixed point of each Ψ_j and D_j is $\Psi_j(0)$ for every $k\le j\le n$, we can let the derivative of Ψ_k^n at the origin be the composition of consecutive D_is for $k\le i\le n-1$.

$$D_k^n = D_k\circ D_{k+1}\circ\cdots\circ D_{n-1}$$

We can decompose D_k^n into two matrices, the matrix whose diagonal entries are ones and the diagonal matrix by reshuffling.

Remark 5.1. The notations $t_{n+1,\,n},\mathbf{u}_{n+1,\,n}$ and $\mathbf{d}_{n+1,\,n}$ are simplified as $t_n,\mathbf{u}_n$ and $\mathbf{d}_n$ like the notations used in (5.4). Moreover, $\alpha_{n+1,\,n},\sigma_{n+1,\,n}$ are abbreviated as α_n,σ_n respectively. Thus $\alpha_n=\sigma^2(1+O(\rho^n)),\ \sigma_n=-\sigma(1+O(\rho^n))$. Using the similar abbreviation, D_n denote D_n^{n+1} and s_n is the s_n^{n+1}.

Lemma 5.3. *The derivative of Ψ_k^n at the origin, D_k^n is decomposed into the dilation and non dilation parts as follows*

$$D_k^n = \begin{pmatrix} 1 & t_{n,\,k} & \mathbf{u}_{n,\,k}\\ & 1 & \\ & \mathbf{d}_{n,\,k} & 1\end{pmatrix}\begin{pmatrix}\alpha_{n,\,k} & & \\ & \sigma_{n,\,k} & \\ & & \sigma_{n,\,k}\cdot\mathrm{Id}_{m\times m}\end{pmatrix}.$$

Moreover, $\alpha_{n,\,k}=(\sigma^2)^{n-k}(1+O(\rho^k))$ and $\sigma_{n,\,k}=(-\sigma)^{n-k}(1+O(\rho^k))$ for some $\rho\in(0,1)$.

Each $t_{n,\,k}$*,* $\mathbf{u}_{n,\,k}$ *and* $\mathbf{d}_{n,\,k}$ *are comparable with the* $t_{k+1,\,k}$*,* $\mathbf{u}_{k+1,\,k}$ *and* $\mathbf{d}_{k+1,\,k}$ *respectively and converges to the numbers* $t_{*,\,k}$*,* $\mathbf{u}_{*,\,k}$ *and* $\mathbf{d}_{*,\,k}$ *super exponentially fast as* $n \to \infty$*.*

Proof. Using the definition of each derivatives of Ψ_j on the equation (5.4) at the fixed point zero, we obtain

$$D^n_k = \prod_{j=k}^{n-1} D_j = \prod_{j=k}^{n-1} \begin{pmatrix} \alpha_j & \sigma_j\, t_j & \sigma_j\, \mathbf{u}_j \\ & \sigma_j & \\ & \sigma_j\, \mathbf{d}_j & \sigma_j \cdot \mathrm{Id}_{m\times m} \end{pmatrix}.$$

By the straightforward calculation, we have following matrix,

$$D^n_k = \begin{pmatrix} \displaystyle\prod_{j=k}^{n-1} \alpha_j & T_{n,\,k} & \mathbf{U}_{n,\,k} \\ & \displaystyle\prod_{j=k}^{n-1} \sigma_j & \\ & \displaystyle\prod_{j=k}^{n-1} \sigma_j \sum_{j=k}^{n-1} \mathbf{d}_j & \displaystyle\prod_{j=k}^{n-1} \sigma_j \cdot \mathrm{Id}_{m\times m} \end{pmatrix} \tag{5.10}$$

where

$$\begin{aligned} \mathbf{U}_{n,\,k} \;=\;& \sigma_k\, \sigma_{k+1}\, \sigma_{k+2} \cdots \sigma_{n-2}\, \sigma_{n-1}\, \mathbf{u}_k \\ & + \alpha_k\, \sigma_{k+1}\, \sigma_{k+2} \cdots \sigma_{n-2}\, \sigma_{n-1}\, \mathbf{u}_{k+1} \\ & + \alpha_k\, \alpha_{k+1}\, \sigma_{k+2} \cdots \sigma_{n-2}\, \sigma_{n-1}\, \mathbf{u}_{k+2} \\ & \qquad\vdots \\ & + \alpha_k\, \alpha_{k+1}\, \alpha_{k+2} \cdots \alpha_{n-2}\, \sigma_{n-1}\, \mathbf{u}_{n-1} \end{aligned}$$

$$\begin{aligned} T_{n,\,k} \;=\;& \sigma_k\, \sigma_{k+1}\, \sigma_{k+2} \cdots \sigma_{n-3}\, \sigma_{n-2}\, \sigma_{n-1} \left[\, \mathbf{u}_k \cdot (\mathbf{d}_{k+1} + \mathbf{d}_{k+2} + \mathbf{d}_{k+3} + \cdots + \mathbf{d}_{n-1}) + t_k \right] \\ & + \alpha_k\, \sigma_{k+1}\, \sigma_{k+2} \cdots \sigma_{n-3}\, \sigma_{n-2}\, \sigma_{n-1} \left[\mathbf{u}_{k+1} \cdot (\qquad \mathbf{d}_{k+2} + \mathbf{d}_{k+3} + \cdots + \mathbf{d}_{n-1}) + t_{k+1} \right] \\ & + \alpha_k\, \alpha_{k+1}\, \sigma_{k+2} \cdots \sigma_{n-3}\, \sigma_{n-2}\, \sigma_{n-1} \left[\mathbf{u}_{k+2} \cdot (\qquad\qquad \mathbf{d}_{k+3} + \cdots + \mathbf{d}_{n-1}) + t_{k+2} \right] \\ & \qquad\qquad\vdots \\ & + \alpha_k\, \alpha_{k+1}\, \alpha_{k+2} \cdots \alpha_{n-3}\, \sigma_{n-2}\, \sigma_{n-1} \left[\mathbf{u}_{n-2} \cdot \mathbf{d}_{n-1} + t_{n-2} \right] \\ & + \alpha_k\, \alpha_{k+1}\, \alpha_{k+2} \cdots \alpha_{n-3}\, \alpha_{n-2}\, \sigma_{n-1} \cdot t_{n-1}. \end{aligned}$$

Moreover,

$$\begin{aligned} \sigma_{n,\,k} &= \prod_{j=k}^{n-1} \sigma_j = \prod_{j=k}^{n-1} (-\sigma)(1 + O(\rho^j)) = (-\sigma)^{n-k}(1 + O(\rho^k)) \\ \alpha_{n,\,k} &= \prod_{j=k}^{n-1} \alpha_j = \prod_{j=k}^{n-1} \sigma^2(1 + O(\rho^j)) = \sigma^{2(n-k)}(1 + O(\rho^k)) \end{aligned} \tag{5.11}$$

By the definition of $\mathbf{d}_{n,\,k}$ and (5.11), each components of the diffeomorphic part and the scaling part are separated

$$\begin{aligned} \mathbf{d}_{n,\,k} &= \sum_{j=k}^{n-1} \mathbf{d}_j \\ \mathbf{u}_{n,\,k} &= \sum_{j=k}^{n-2} (-\sigma)^{j-k} \mathbf{u}_j \, (1 + O(\rho^k)) \\ t_{n,\,k} &= \sum_{j=k}^{n-1} (-\sigma)^{j-k} \left[\mathbf{u}_j \cdot \sum_{i=j}^{n-2} \mathbf{d}_{i+1} + t_j + t_{n-1} \right] (1 + O(\rho^k)). \end{aligned} \tag{5.12}$$

Since $\|\mathbf{d}_j\| = O\big(\bar\varepsilon^{2^j}\big)$, $\|\mathbf{u}_j\| = O\big(\bar\varepsilon^{2^j}\big)$ and $|t_j| = O\big(\bar\varepsilon^{2^j}\big)$ for each $j \in \mathbb{N}$, each terms of the series in (5.12) shrink super exponentially fast. Then the sum $\mathbf{d}_{n,\,k}$, $\mathbf{u}_{n,\,k}$ and $t_{n,\,k}$ are comparable with the first terms of each series. Moreover, $\mathbf{d}_{n,\,k}$, $\mathbf{u}_{n,\,k}$ and $t_{n,\,k}$ converge to $\mathbf{d}_{*,\,k}$, $\mathbf{u}_{*,\,k}$ and $t_{*,\,k}$ as $n \to \infty$ super exponentially fast respectively. □

After reshuffling of Ψ^n_k, we can factor out D^n_k from the map Ψ^n_k. Then we have

$$\Psi^n_k = D^n_k \circ (\operatorname{id} + \mathbf{S}^n_k) \tag{5.13}$$

where $\mathbf{S}^n_k = (S^n_k(w),\ 0,\ \mathbf{R}_{n,\,k}(y)) = O(|w|^2)$ near the origin. When we calculate directly the composition, $H^{-1}_k \circ \Lambda^{-1}_k \circ \cdots \circ H^{-1}_{n-1} \circ \Lambda^{-1}_{n-1}$. Observe that the map

$$\mathbf{R}_{n,k} = (R^1_{n,\,k},\ R^2_{n,\,k},\ \ldots,\ R^m_{n,\,k})$$

depends only on y.

Proposition 5.4. *The third coordinate of* $\mathbf{S}^n_k$, $\mathbf{R}_{n,\,k}(y)$ *has the following norm estimations.*

$$\|\mathbf{R}_{n,k}\| = O\big(\bar\varepsilon^{2^k}\big), \quad \|(\mathbf{R}_{n,k})'\| = O\big(\bar\varepsilon^{2^k}\sigma^{n-k}\big) \quad \textit{and} \quad \|(\mathbf{R}_{n,k})''\| = O\big(\bar\varepsilon^{2^k}\sigma^{2(n-k)}\big)$$

for all $k < n$.

Proof. The proof comes from the recursive formula between each partial derivatives of S^n_k and S^n_{k+1}. So before proving this lemma we need some intermediate calculations. For a point $w = (x, y, \mathbf{z}) \in B$, let

$$w^n_{k+1} = \begin{pmatrix} x^n_{k+1} \\ y^n_{k+1} \\ \mathbf{z}^n_{k+1} \end{pmatrix} = \Psi^n_{k+1}(w) \in B^n_{k+1}$$

By the equation (5.13), we have

$$\begin{pmatrix} x^n_{k+1} \\ y^n_{k+1} \\ \mathbf{z}^n_{k+1} \end{pmatrix} = \begin{pmatrix} \alpha_{n,\,k+1} & \sigma_{n,\,k+1} \cdot t_{n,\,k+1} & \sigma_{n,\,k+1} \cdot \mathbf{u}_{n,\,k+1} \\ & \sigma_{n,\,k+1} & \\ & \sigma_{n,\,k+1} \cdot \mathbf{d}_{n,\,k+1} & \sigma_{n,\,k+1} \cdot \operatorname{Id}_{m\times m} \end{pmatrix} \begin{pmatrix} x + S^n_{k+1}(w) \\ y \\ \mathbf{z} + \mathbf{R}_{n,\,k+1}(y) \end{pmatrix}.$$

Then each coordinate of w^n_{k+1} is

$$\begin{aligned} x^n_{k+1} &= \alpha_{n,\,k+1}(x + S^n_{k+1}(w)) + \sigma_{n,\,k+1}\, t_{n,\,k+1} \cdot y + \sigma_{n,\,k+1}\mathbf{u}_{n,\,k+1} \cdot (\mathbf{z} + \mathbf{R}_{n,\,k+1}(y)) \\ y^n_{k+1} &= \sigma_{n,\,k+1} \cdot y \\ \mathbf{z}^n_{k+1} &= \sigma_{n,\,k+1}\, \mathbf{d}_{n,\,k+1} \cdot y + \sigma_{n,\,k+1}\, (\mathbf{z} + \mathbf{R}_{n,\,k+1}(y)). \end{aligned} \tag{5.14}$$

For any fixed $k < n$, the recursive formula of Ψ^n_k is

$$\begin{aligned} D^n_k \circ (\mathrm{id} + \mathbf{S}^n_k) = \Psi^n_k = \Psi_k \circ \Psi^n_{k+1} &= D_k \circ (\mathrm{id} + \mathbf{s}_k) \circ \Psi^n_{k+1} \\ &= D^n_k \circ (\mathrm{id} + \mathbf{S}^n_{k+1}) + D_k \circ \mathbf{s}_k \circ \Psi^n_{k+1} \\ \text{Thus} \qquad \Psi^n_k(w) &= D^n_k \circ (\mathrm{id} + \mathbf{S}^n_{k+1})(w) + D_k \circ \mathbf{s}_k(w^n_{k+1}) \end{aligned} \tag{5.15}$$

and note that

$$D_k \circ \mathbf{s}_k(w^n_{k+1}) = \begin{pmatrix} \alpha_k & \sigma_k t_k & \sigma_k\, \mathbf{u}_k \\ & \sigma_k & \\ & \sigma_k\, \mathbf{d}_k & \sigma_k \cdot \mathrm{Id}_{m\times m} \end{pmatrix} \begin{pmatrix} s_k(w^n_{k+1}) \\ 0 \\ \mathbf{r}_k(y^n_{k+1}) \end{pmatrix}.$$

Moreover, the first partial derivatives of each coordinate are as follows

$$\begin{aligned} \frac{\partial x^n_{k+1}}{\partial x} &= \alpha_{n,\,k+1}\left(1 + \frac{\partial S^n_{k+1}}{\partial x}(w)\right) \\ \frac{\partial x^n_{k+1}}{\partial y} &= \alpha_{n,\,k+1}\frac{\partial S^n_{k+1}}{\partial y}(w) + \sigma_{n,\,k+1}\, t_{n,\,k+1} + \sigma_{n,\,k+1}\, \mathbf{u}_{n,\,k+1} \cdot (\mathbf{R}_{n,\,k+1})'(y) \\ \frac{\partial x^n_{k+1}}{\partial z_i} &= \alpha_{n,\,k+1}\frac{\partial S^n_{k+1}}{\partial z_i}(w) + \sigma_{n,\,k+1}\, u^i_{n,\,k+1} \\ \frac{\partial y^n_{k+1}}{\partial y} &= \frac{\partial \mathbf{z}^n_{k+1}}{\partial z_i} = \sigma_{n,\,k+1} \\ \frac{\partial \mathbf{z}^n_{k+1}}{\partial y} &= \sigma_{n,\,k+1}\, \mathbf{d}_{n,\,k+1} + \sigma_{n,\,k+1} \cdot (\mathbf{R}_{n,\,k+1})'(y) \\ \frac{\partial y^n_{k+1}}{\partial x} &= \frac{\partial y^n_{k+1}}{\partial z_i} = \frac{\partial z^n_{k+1}}{\partial x} = 0 \end{aligned} \tag{5.16}$$

for every $1 \leq i \leq m$. In order to estimate of $\mathbf{R}_{n,\,k}(y)$, compare the third coordinates of the functions in (5.15). Recall $\sigma^{-1} = \lambda$. Then

$$\begin{aligned} \mathbf{z}^n_k &= \sigma_{n,\,k}\, \mathbf{d}_{n,\,k} \cdot y + \sigma_{n,\,k}(\mathbf{z} + \mathbf{R}_{n,\,k}(y)) \\ &= \sigma_{n,\,k}\, \mathbf{d}_{n,\,k} \cdot y + \sigma_{n,\,k}(\mathbf{z} + \mathbf{R}_{n,\,k+1}(y)) + \sigma_k \cdot \mathbf{r}_k(y^n_{k+1}) \end{aligned}$$

Then

$$\mathbf{R}_{n,\,k}(y) = \mathbf{R}_{n,\,k+1}(y) + \sigma^{-1}_{n,\,k} \cdot \sigma_k \cdot \mathbf{r}_k(y^n_{k+1})$$

where $\sigma^{-1}_{n,\,k} \cdot \sigma_k$ is $(-\lambda)^{n-k-1}(1 + O(\rho^k))$. By the equation (5.16), the recursive relation between $\mathbf{R}^n_k(y)$, $\mathbf{R}^n_{k+1}(y)$ and the bounds of $\mathbf{r}_k(y^n_{k+1})$, we obtain the following formulas

$$\begin{aligned}\mathbf{R}_{n,\,k}(y) &= \mathbf{R}_{n,\,k+1}(y) + O\big((-\lambda)^{n-k-1}\mathbf{r}_k(y^n_{k+1})\big)\\ (\mathbf{R}_{n,\,k})'(y) &= (\mathbf{R}_{n,\,k+1})'(y) + O\big(\mathbf{r}'_k(y^n_{k+1})\big)\\ \text{and}\quad (\mathbf{R}_{n,\,k})''(y) &= (\mathbf{R}_{n,\,k+1})''(y) + O\big(\sigma^{n-k}\cdot\mathbf{r}''_k(y^n_{k+1})\big).\end{aligned}$$

Hence, by the equation (5.14) and the chain rule

$$\begin{aligned}\|\mathbf{R}_{n,\,k}\| &\le \|\mathbf{R}_{n,\,k+1}\| + K_0\bar{\varepsilon}^{2^k}\\ \|(\mathbf{R}_{n,\,k})'\| &\le \|(\mathbf{R}_{n,\,k+1})'\| + K_1\bar{\varepsilon}^{2^k}\sigma^{n-k}\\ \|(\mathbf{R}_{n,\,k})''\| &\le \|(\mathbf{R}_{n,\,k+1})''\| + K_2\bar{\varepsilon}^{2^k}\sigma^{2(n-k)}\end{aligned}$$

for all $k<n$. Then,

$$\|\mathbf{R}_{n,k}\| = O(\bar{\varepsilon}^{2^k}),\quad \|(\mathbf{R}_{n,\,k})'\| = O(\bar{\varepsilon}^{2^k}\sigma^{n-k})\ \text{ and }\ \|(\mathbf{R}_{n,\,k})''\| = O(\bar{\varepsilon}^{2^k}\sigma^{2(n-k)})$$

for all $k<n$. □

Lemma 5.5. *For $k<n$, we have*

(1) $|\partial_x S^n_k| = O(1)$, $|\partial_y S^n_k| = O(\bar{\varepsilon}^{2^k})$, $|\partial_{z_i} S^n_k| = O(\bar{\varepsilon}^{2^k})$
(2) $|\partial^2_{xy} S^n_k| = O(\bar{\varepsilon}^{2^k}\sigma^{n-k})$, $|\partial^2_{xz_i} S^n_k| = O(\bar{\varepsilon}^{2^k}\sigma^{n-k})$
(3) $|\partial^2_{yz_i} S^n_k| = O(\bar{\varepsilon}^{2^k})$, $|\partial^2_{z_iz_j} S^n_k| = O(\bar{\varepsilon}^{2^k})$.

for every $1\le i,j\le m$.

Proof. Compare the first coordinates of Ψ^n_k in (5.15). Thus

$$\begin{aligned}x^n_k &= \alpha_{n,\,k}(x + S^n_k(w)) + \sigma_{n,\,k}\,t_{n,\,k}\cdot y + \sigma_{n,\,k}\,\mathbf{u}_{n,\,k}\cdot\big(\mathbf{z} + \mathbf{R}_{n,\,k}(y)\big)\\ &= \alpha_{n,\,k}(x + S^n_{k+1}(w)) + \sigma_{n,\,k}\,t_{n,\,k}\cdot y + \sigma_{n,\,k}\,\mathbf{u}_{n,\,k}\cdot\big(\mathbf{z} + \mathbf{R}_{n,\,k+1}(y)\big) + \alpha_k\cdot s_k(w^n_{k+1})\\ &\qquad + \sigma_k\,\mathbf{u}_k\cdot\mathbf{r}_k(y^n_{k+1}).\end{aligned}$$

Then we obtain the recursive formula for S^n_k as follows

$$\begin{aligned}S^n_k(w) &= S^n_{k+1}(w) + \alpha^{-1}_{n,\,k}\,\alpha_k\cdot s_k(w^n_{k+1}) + \alpha^{-1}_{n,\,k}\,\sigma_{n,\,k}\,\mathbf{u}_{n,\,k}\cdot\big(\mathbf{R}_{n,\,k+1}(y) - \mathbf{R}_{n,\,k}(y)\big)\\ &\qquad + \alpha^{-1}_{n,\,k}\,\sigma_k\,\mathbf{u}_k\cdot\mathbf{r}_k(y^n_{k+1}).\end{aligned}$$

Let us take the first partial derivatives of each side of above equation and use (5.16). Then we can have the recursive formulas of each first partial derivatives of $S^n_k(w)$. Let us take the coordinate expression of w^n_{k+1} as $(x^n_{k+1}, y^n_{k+1}, (z^n_{k+1})_1, (z^n_{k+1})_2, \ldots, (z^n_{k+1})_m)$. Then

$$\begin{aligned}\frac{\partial S^n_k}{\partial x} &= \frac{\partial S^n_{k+1}}{\partial x}\left(1 + \frac{\partial s_k}{\partial x^n_{k+1}}\right) + \frac{\partial s_k}{\partial x^n_{k+1}}\\ \frac{\partial S^n_k}{\partial y} &= \left(1 + \frac{\partial s_k}{\partial x^n_{k+1}}\right)\frac{\partial S^n_{k+1}}{\partial y} + K_1\lambda^{n-k-1}\left[\Big(t_{n,\,k+1} + \mathbf{u}_{n,\,k+1}\cdot(\mathbf{R}_{n,\,k+1})'(y)\Big)\frac{\partial s_k}{\partial x^n_{k+1}}\right.\\ &\qquad\left. + \frac{\partial s_k}{\partial y^n_{k+1}} + \sum_{j=1}^{m}\Big(d^j_{n,\,k+1} + (\mathbf{R}^j_{n,\,k+1})'(y)\Big)\frac{\partial s_k}{\partial(z^n_{k+1})_j}\right]\end{aligned}$$

$$+ K_1\lambda^{n-k-1}\mathbf{u}_{n,\,k}\cdot\Big((\mathbf{R}_{n,\,k+1})'(y) - (\mathbf{R}_{n,\,k})'(y)\Big) + K_2\lambda^{n-k}\mathbf{u}_k\cdot\mathbf{r}'_k(y_n^{k+1})$$

$$\frac{\partial S_k^n}{\partial z_i} = \left(1+\frac{\partial s_k}{\partial x_{k+1}^n}\right)\frac{\partial S_{k+1}^n}{\partial z_i} + K_1\lambda^{n-k-1}\left[u^i_{n,\,k+1}\frac{\partial s_k}{\partial x^n_{k+1}} + \frac{\partial s_k}{\partial (z^n_{k+1})_i}\right]$$

where $\alpha_{n,\,k}^{-1}\,\alpha_k\,\sigma_{n,\,k+1} = K_1(-\lambda)^{n-k-1}$ and $\alpha_{n,\,k}^{-1}\,\sigma_{n,\,k+1} = K_2(-\lambda)^{n-k+1}$ for each $1 \leq i \leq m$. By Corollary 5.2 and Proposition 5.4, $|\,\partial s_k/\partial x^n_{k+1}|$ is $O(\sigma^{n-k})$ and $|\,\partial s_k/\partial y^n_{k+1}|$ and $|\,\partial s_k/\partial (z^n_{k+1})_i|$ is $O(\bar{\varepsilon}^{2^k}\sigma^{n-k})$ for all $1 \leq i \leq m$. Moreover, $|t_{n,\,k}|$, $\|\,\mathbf{u}_{n,\,k}\|$ and $\|\,\mathbf{d}_{n,\,k}\|$ are $O(\bar{\varepsilon}^{2^k})$. With all these facts, the bounds of each partial derivatives of S^n_k are as follows

$$\begin{aligned}
\left|\frac{\partial S_k^n}{\partial x}\right| &\leq (1+O(\rho^{n-k}))\left|\frac{\partial S_{k+1}^n}{\partial x}\right| + C\sigma^{n-k}\\
\left|\frac{\partial S_k^n}{\partial y}\right| &\leq \big(1+O(\rho^{n-k})\big)\left|\frac{\partial S_{k+1}^n}{\partial y}\right| + C\bar{\varepsilon}^{2^k}\\
\left|\frac{\partial S_k^n}{\partial z_i}\right| &\leq \big(1+O(\rho^{n-k})\big)\left|\frac{\partial S_{k+1}^n}{\partial z_i}\right| + C\bar{\varepsilon}^{2^k}
\end{aligned}$$

for all $1 \leq i \leq m$, for some constant $C > 0$ and $\rho \in (0,1)$. Hence, using above recursive formulas we have

$$\left|\frac{\partial S_k^n}{\partial x}\right| = O(\sigma), \quad \left|\frac{\partial S_k^n}{\partial y}\right| = O(\bar{\varepsilon}^{2^k}) \quad \text{and} \quad \left|\frac{\partial S_k^n}{\partial z}\right| = O(\bar{\varepsilon}^{2^k})$$

for all $k < n$. The second partial derivatives of S^n_k are as follows by the chain rule

$$\begin{aligned}
\frac{\partial^2 S_k^n}{\partial xy} = {}& \left(1+\frac{\partial s_k}{\partial x_{k+1}^n}\right)\frac{\partial^2 S_{k+1}^n}{\partial xy} + \alpha_{n,\,k+1}\left(1+\frac{\partial S_{k+1}^n}{\partial x}\right)\frac{\partial^2 s_k}{\partial (x_{k+1}^n)^2}\frac{\partial S_{k+1}^n}{\partial y}\\
&+ \sigma_{n,\,k+1}\left(1+\frac{\partial S_{k+1}^n}{\partial x}\right)\left[\Big(t_{n,\,k+1} + \mathbf{u}_{n,\,k+1}\cdot(\mathbf{R}_{n,\,k+1})'(y)\Big)\frac{\partial^2 s_k}{\partial (x_{k+1}^n)^2} + \frac{\partial^2 s_k}{\partial x_{k+1}^n y_{k+1}^n}\right.\\
&\left.+ \sum_{j=1}^{m}\Big(d^j_{n,\,k+1} + (\mathbf{R}^j_{n,\,k+1})'(y)\Big)\frac{\partial^2 s_k}{\partial x^n_{k+1} z^n_{k+1}}\right]
\end{aligned}$$

$$\begin{aligned}
\frac{\partial^2 S_k^n}{\partial x z_i} = {}& \left(1+\frac{\partial s_k}{\partial x_{k+1}^n}\right)\frac{\partial^2 S_{k+1}^n}{\partial x z_i} + \alpha_{n,\,k+1}\left(1+\frac{\partial S_{k+1}^n}{\partial x}\right)\frac{\partial^2 s_k}{\partial (x_{k+1}^n)^2}\frac{\partial S_{k+1}^n}{\partial z_i}\\
&+ \sigma_{n,\,k+1}\left(1+\frac{\partial S_{k+1}^n}{\partial x}\right)\cdot\left[u^i_{n,\,k+1}\frac{\partial^2 s_k}{\partial (x_{k+1}^n)^2} + \frac{\partial^2 s_k}{\partial x^n_{k+1}(z^n_{k+1})_i}\right]
\end{aligned}$$

$$\begin{aligned}
\frac{\partial^2 S_k^n}{\partial y z_i} = {}& \left(1+\frac{\partial s_k}{\partial x_{k+1}^n}\right)\frac{\partial^2 S_{k+1}^n}{\partial y z_i} + \left[\alpha_{n,\,k+1}\frac{\partial S_{k+1}^n}{\partial z_i}\frac{\partial S_{k+1}^n}{\partial y} + \sigma_{n,\,k+1}u^i_{n,\,k+1}\frac{\partial S_{k+1}^n}{\partial y}\right.\\
&\left.+ \sigma_{n,\,k+1}\Big(t_{n,\,k+1} + \mathbf{u}_{n,\,k+1}\cdot(\mathbf{R}_{n,\,k+1})'(y)\Big)\Big(\frac{\partial S_{k+1}^n}{\partial z_i} + K_1(-\lambda)^{n-k-1}u^i_{n,\,k+1}\Big)\right]\frac{\partial^2 s_k}{\partial (x_{k+1}^n)^2}
\end{aligned}$$

$$
\begin{aligned}
&+ \left(\sigma_{n,\,k+1} \frac{\partial S^n_{k+1}}{\partial z_i} + K_4 u^i_{n,\,k+1}\right) \frac{\partial^2 s_k}{\partial x^n_{k+1} y^n_{k+1}} \\
&+ \left[\sigma_{n,\,k+1}\frac{\partial S^n_{k+1}}{\partial y} + K_4\Big(t_{n,\,k+1} + \mathbf{u}_{n,\,k+1}\cdot(\mathbf{R}_{n,\,k+1})'(y)\Big)\right] \frac{\partial^2 s_k}{\partial x^n_{k+1}(z^n_{k+1})_i} \\
&+ \left(\sigma_{n,\,k+1}\frac{\partial S^n_{k+1}}{\partial z_i} + K_4 u^i_{n,\,k+1}\right)\sum_{j=1}^{m} \Big(d^j_{n,\,k+1} + (\mathbf{R}^j_{n,\,k+1})'(y)\Big)\cdot \frac{\partial^2 s_k}{\partial (z^n_{k+1})_j (z^n_{k+1})_i}
\end{aligned}
$$

$$
\begin{aligned}
\frac{\partial^2 S^n_k}{\partial z_i z_j} &= \left(1 + \frac{\partial s_k}{\partial x^n_{k+1}}\right)\frac{\partial^2 S^n_{k+1}}{\partial z_i z_j} + \left[\alpha_{n,\,k+1}\frac{\partial S^n_{k+1}}{\partial z_i}\cdot\frac{\partial S^n_{k+1}}{\partial z_j} + \sigma_{n,\,k+1} u^j_{n,\,k+1}\frac{\partial S^n_{k+1}}{\partial z_i}\right. \\
&\quad \left. + \,\sigma_{n,\,k+1}\frac{\partial S^n_{k+1}}{\partial z_j} + K_4 (u^j_{n,\,k+1})^2\right]\frac{\partial^2 s_k}{\partial (x^n_{k+1})^2} \\
&+ \left[\sigma_{n,\,k+1}\frac{\partial S^n_{k+1}}{\partial z_i} + K_4 u^i_{n,\,k+1}\right]\frac{\partial^2 s_k}{\partial x^n_{k+1}(z^n_{k+1})_j} \\
&+ \left[\sigma_{n,\,k+1}\frac{\partial S^n_{k+1}}{\partial z_j} + K_4 u^j_{n,\,k+1}\right]\frac{\partial^2 s_k}{\partial x^n_{k+1}(z^n_{k+1})_i} + K_4\frac{\partial^2 s_k}{\partial (z^n_{k+1})_i (z^n_{k+1})_j}
\end{aligned}
$$

where $K_4 = \alpha^{-1}_{n,\,k}\,\alpha_k\,\sigma^2_{n,\,k+1} = O(1)$ for every $1 \leq i, j \leq m$.

By Lemma 5.9, Corollary 5.2, and Proposition 5.4, the bounds of $|\,\partial^2 s_k/\partial (x^n_{k+1})^2|$ is $O(\sigma^{n-k})$ and $|\,\partial^2 s_k/\partial uv|$ is $O(\bar{\varepsilon}^{2^k}\sigma^{n-k})$ where $u, v = x^n_{k+1},\ y^n_{k+1},\ (z^n_{k+1})_1,\ \ldots\ , (z^n_{k+1})_m$ but both u and v are not x^n_{k+1} simultaneously. The upper bounds of the norm of the first and the second partial derivatives of s_k and the estimation of $|\,t_{n,\,k}|$, $\|\,\mathbf{u}_{n,\,k}\|$ and $\|\,\mathbf{d}_{n,\,k}\|$ imply the bounds of norm of second partial derivatives of S^n_k as follows.

$$
\begin{aligned}
\left|\frac{\partial^2 S^n_k}{\partial xy}\right| &\leq \big(1 + O(\rho^{n-k})\big)\left|\frac{\partial^2 S^n_{k+1}}{\partial xy}\right| + C\bar{\varepsilon}^{2^k}\sigma^{n-k} \\
\left|\frac{\partial^2 S^n_k}{\partial x z_i}\right| &\leq \big(1 + O(\rho^{n-k})\big)\left|\frac{\partial^2 S^n_{k+1}}{\partial x z_i}\right| + C\bar{\varepsilon}^{2^k}\sigma^{n-k} \\
\left|\frac{\partial^2 S^n_k}{\partial y z_i}\right| &\leq \big(1 + O(\rho^{n-k})\big)\left|\frac{\partial^2 S^n_{k+1}}{\partial y z_i}\right| + C\bar{\varepsilon}^{2^k} \\
\left|\frac{\partial^2 S^n_k}{\partial z_i z_j}\right| &\leq \big(1 + O(\rho^{n-k})\big)\left|\frac{\partial^2 S^n_{k+1}}{\partial z_i z_j}\right| + C\bar{\varepsilon}^{2^k}\ .
\end{aligned}
$$

Hence, $|\partial^2_{xy} S^n_k| = O(\bar{\varepsilon}^{2^k}\sigma^{n-k})$, $|\partial^2_{xz_i} S^n_k| = O(\bar{\varepsilon}^{2^k}\sigma^{n-k})$, $|\partial^2_{yz_i} S^n_k| = O(\bar{\varepsilon}^{2^k})$, and $|\partial^2_{z_iz_j} S^n_k| = O(\bar{\varepsilon}^{2^k})$ for every $1 \leq i, j \leq m$. □

5.3. Universal properties of coordinate change map, Ψ^n_k. On the following Lemma 5.8, we would show that the non-linear part of the coordinate change map $\mathrm{id} + S(x, y, \mathbf{z})$ is a small perturbation of the one-dimensional universal function. The content of this section is to rephrase some parts of Section 7 in [CLM].

Recall the one dimensional map $f_*\colon I \to I$ is the fixed point of the (periodic doubling) renormalization operator of the unimodal maps, namely, $Rf_* = f_*$. Let the critical point of f_* be c_* and $I = [-1, 1]$. Also assume that $f_*(c_*) = 1$ and $f_*^2(c_*) = -1$. Let us take the intervals $J_c^* = [-1, f_*^4(c_*)]$ and $J_v^* = f_*(J_c^*) = [f_*^3(c_*), 1]$. Then these intervals are the smallest invariant intervals under f_*^2 around the critical point and the critical value respectively. Observe that the critical point c_* is in J_c^* and $f_*(J_v^*) = J_c^*$. Let the onto map $s\colon J_c^* \to I$ be the orientation reversing affine rescaling. Thus $s \circ f_*\colon J_v^* \to [-1, 1]$ is an expanding diffeomorphism. We can consider the inverse contraction

$$g_*\colon I \to J_v^*, \quad g_* = f_*^{-1} \circ s^{-1}$$

where f_*^{-1} is the branch of the inverse function which maps J_c^* onto J_v^*. The map g_* is called the *presentation function* and it has the unique fixed point at 1. By the definition of g_* implies that

$$f_*^2 | J_v^* = g_* \circ f_* \circ (g_*)^{-1}$$

Then by the appropriate rescaling of the presentation function, g_*, we can define the *renormalization at the critical value*, $R_v^n f_*$. Inductively we can define g_*^n on the smallest interval $J_v^*(n)$ containing the critical value 1 with period 2^n. Let $G_*^n\colon I \to I$ be the diffeomorphism of the rescaled map of g_*^n.

Then the fact that g_* is the contraction implies the existence of the limit.

$$u_* = \lim_{n \to \infty} G_*^n\colon I \to I$$

and the convergence is exponentially fast in C^3 topology. Moreover, we see the following lemmas in [CLM].

Lemma 5.6 (Lemma 7.1 in [CLM])**.** *For every $n \geq 1$*

(1) $J_v^*(n) = g_*^n(I)$

(2) $R_v^n f_* = G_*^n \circ f_* \circ (G_*^n)^{-1}$

(3) $u_* \circ f_* = f^* \circ u_*$

Lemma 5.7 (Lemma 7.3 in [CLM])**.** *Assume that there is the sequence of smooth functions $g_k\colon I \to I,\ \ k = 1, 2, \dots n$ such that $\|g_k - g_*\|_{C^3} \leq C\rho^k$ where the $g_* = \lim_{k \to \infty} g_k$ for some constant $C > 0$ and $\rho \in (0, 1)$. Let $g_k^n = g_k \circ \cdots \circ g_n$ and let $G_k^n = a_k^n \circ g_k^n\colon I \to I$, where a_k^n is the affine rescaling of $\operatorname{Im} g_k^n$ to I. Then $\|G_k^n - G_*^{n-k}\|_{C^1} \leq C_1\rho^{n-k}$, where C_1 depends only on ρ and C.*

Let us normalize the functions u_* and g_* which have the fixed point at the origin and the derivatives at the origin is 1. Let

$$v_*(x) = \frac{u_*(x+1) - 1}{u_*'(1)}$$

Abusing notation, we denote the normalized function of $g_*(x)$ to be also the $g_*(x)$ in the following lemma.

Lemma 5.8. *There exists the positive constant $\rho < 1$ such that for all $k < n$ and for every $y \in I^y$ and $z \in I^z$*

$$|\operatorname{id} + S_k^n(\,\cdot\,, y, \mathbf{z}) - v_*(\,\cdot\,)| = O(\bar{\varepsilon}^{2^k} y + \bar{\varepsilon}^{2^k} \sum_j z_j + \rho^{n-k})$$

$$\textit{and}\quad |\,1+\partial_x S^n_k(\,\cdot\,,y,\mathbf{z}) - v'_*(\,\cdot\,)| = O(\rho^{n-k}).$$

Proof. The map $\mathrm{id} + S^n_k(\,\cdot\,,y,\mathbf{z})$ is the normalized map of Ψ^n_k such that the derivative at the origin is the identity map, and $v_*(\,\cdot\,)$ is also the normalized map of u_*, which is the conjugation of the renormalization fixed point at the critical point and the critical value in Lemma 5.6. Thus the normalized map, $\mathrm{id} + S^n_k(\,\cdot\,,0,\mathbf{0})$ and the one dimensional map, G^n_* converge to the same function $v_*(\,\cdot\,)$ as $n \to \infty$ because the critical value of f and the tip of F moved to the origin as the fixed point of each function g^n_* by the appropriate affine conjugation.

By Lemma 5.5 we have

$$|\,\partial_y S^n_k|\; = O(\bar{\varepsilon}^{2^k}), \qquad |\,\partial_{z_i} S^n_k|\; = O(\bar{\varepsilon}^{2^k})$$

for all $1 \leq i \leq m$ and moreover,

$$|\,\partial^2_{xy} S^n_k| = O(\bar{\varepsilon}^{2^k}\sigma^{n-k}), \qquad |\,\partial^2_{xz_i} S^n_k| = O(\bar{\varepsilon}^{2^k}\sigma^{n-k})$$

for all $1 \leq i \leq m$. Thus the proof of asymptotic along the section parallel to $x-$axis is enough to prove the whole lemma. By Lemma **??**,

$$\mathrm{dist}_{C^3}(\,\mathrm{id} + s_k(\,\cdot\,,0,\mathbf{0}),\ g_*(\,\cdot\,)) = O(\rho^k)$$

and by Lemma 5.7, we obtain

$$\mathrm{dist}_{C^1}(\,\mathrm{id} + S^n_k(\,\cdot\,,0,\mathbf{0}),\ G^{n-k}_*(\,\cdot\,)) = O(\rho^{n-k}). \tag{5.17}$$

Since the $G^n_* \to v_*$ exponentially fast, we have the exponential convergence of the function $\mathrm{id} + S^n_k(\,\cdot,0,\mathbf{0})$ to $v_*(\,\cdot\,)$. Hence, the above asymptotic and the exponential convergence at the origin prove the first part of the lemma. Furthermore, C^1 convergence of (5.17) implies that

$$|\,1+\partial_x S^n_k(\,\cdot\,,0,\mathbf{0}) - v'_*(\,\cdot\,)| = O(\rho^{n-k})$$

where $\rho \in (0,1)$. □

5.4. Estimation of the quadratic part of S^n_k for n. We estimate the asymptotic of S^n_k using the estimation of the partial derivatives and recursive formulas. Then it implies the estimation of the asymptotic of the non-linear part of Ψ^n_k for n. In order to simplify notations, we would treat the case $k=0$ and consider the behavior of S^n_0 instead of S^n_k.
In this section, let the variable y be z_0 if we express the quadratic sum of y and z_j variables to simplify the notations.

Lemma 5.9. *The following asymptotic is true*

$$\Big|[\,x + S^n_0(x,y,\mathbf{z})] - [\,v_*(x) + \sum_{0\leq i,j\leq m} a_{F,\,ij}\, z_i z_j\,]\Big| = O(\rho^n)$$

where constants $|a_{F,ij}|$ are $O(\bar{\varepsilon})$ for all $0 \leq i,j \leq m$ and for some $\rho \in (0,1)$.

Proof. For any fixed $k \geq 0$, the recursive formula for $n > k$ comes from the $\Psi^{n+1}_k = \Psi^n_k \circ \Psi^{n+1}_n$. Thus

$$\mathbf{S}^{n+1}_k(w) = \mathbf{s}_n(w) + D^{-1}_n \circ \mathbf{S}^n_k \circ D_n \circ (\mathrm{id} + \mathbf{s}_n)(w). \tag{5.18}$$

Let $k=0$ for simplicity, and compare each coordinates of the both sides. Then

$$
\begin{aligned}
&(S_0^{n+1}(w),\ 0,\ \mathbf{R}_{n+1,\,0}(y)) \\
&= (s_n(w),\ 0,\ \mathbf{r}_n(y)) + \begin{pmatrix} \alpha_n^{-1} & \alpha_n^{-1}(-t_n + \mathbf{u}_n \cdot \mathbf{d}_n) & -\alpha_n^{-1}\mathbf{u}_n \\ & \sigma_n^{-1} & \\ & -\sigma_n^{-1}\mathbf{d}_n & \sigma_n^{-1} \cdot \mathrm{Id}_{m\times m} \end{pmatrix} \begin{pmatrix} S_0^n(w) \\ 0 \\ \mathbf{R}_{n,\,0}(y) \end{pmatrix} \\
&\qquad\qquad \circ \begin{pmatrix} \alpha_n & \sigma_n t_n & \sigma_n \mathbf{u}_n \\ & \sigma_n & \\ & \sigma_n \mathbf{d}_n & \sigma_n \cdot \mathrm{Id}_{m\times m} \end{pmatrix} \begin{pmatrix} x + s_n(w) \\ y \\ \mathbf{z} + \mathbf{r}_n(y) \end{pmatrix}.
\end{aligned}
$$

By the direct calculation, we obtain the following equation

$$
\begin{aligned}
&(S_0^{n+1}(w),\ 0,\ \mathbf{R}_{n+1,\,0}(y)) \\
&= (s_n(w),\ 0,\ \mathbf{r}_n(y)) + \left(\frac{1}{\alpha_n}\, S_0^n(w) - \frac{1}{\alpha_n}\,\mathbf{u}_n \cdot \mathbf{R}_{n,\,0}(y),\ 0,\ \frac{1}{\sigma_n}\,\mathbf{R}_{n,\,0}(y)\right) \circ \\
&\qquad \Big(\alpha_n(x + s_n(w)) + \sigma_n t_n y + \sigma_n \mathbf{u}_n \cdot (\mathbf{z} + \mathbf{r}_n(y)),\ \sigma_n y,\ \sigma_n \mathbf{d}_n y + \sigma_n(\mathbf{z} + \mathbf{r}_n(y))\Big) \\
&= (s_n(w),\ 0,\ \mathbf{r}_n(y)) \\
&\quad + \Bigg(\frac{1}{\alpha_n}\, S_0^n\Big(\alpha_n(x + s_n(w)) + \sigma_n t_n y + \sigma_n \mathbf{u}_n \cdot (\mathbf{z} + \mathbf{r}_n(y)),\ \sigma_n y,\ \sigma_n \mathbf{d}_n y + \sigma_n(\mathbf{z} + \mathbf{r}_n(y))\Big) \\
&\qquad\quad - \frac{1}{\alpha_n}\,\mathbf{u}_n \cdot \mathbf{R}_{n,\,0}(\sigma_n y),\ 0,\ \frac{1}{\sigma_n}\,\mathbf{R}_{n,\,0}(\sigma_n y)\Bigg).
\end{aligned}
$$

Firstly, let us compare from third to $m+2$ coordinates of each side of the above equation. Using the Taylor's expansion and Lemma 5.1, we obtain

$$
\mathbf{R}_{n+1,\,0}(y) = \mathbf{r}_n(y) + \frac{1}{\sigma_n}\,\mathbf{R}_{n,\,0}(\sigma_n y)
$$

Recall the coordinate expression of $\mathbf{R}_{n,\,0}(y) = \big(\, R^1_{n,\,0}(y),\ R^2_{n,\,0}(y),\ \ldots,\ R^m_{n,\,0}(y)\,\big)$. Then we have the following form of $R^j_{n,\,0}(y)$.

$$
\begin{aligned}
R^j_{n,\,0}(y) &= a^j_n\, y^2 + A^j_n(y)\, y^3 \\
R^j_{n+1,\,0}(y) &= \frac{1}{\sigma_n}\left(a^j_n \cdot (\sigma_n y)^2 + A^j_n(\sigma_n y) \cdot (\sigma_n y)^3\right) + c^j_n\, y^2 + O(\bar{\varepsilon}^{2^n} y^3).
\end{aligned}
$$

for each $1 \le j \le m$. Thus $a^j_{n+1} = \sigma_n a^j_n + c^j_n$ and $\|A^j_{n+1}\| \le \|\,\sigma_n\|^2 \|A^j_n\| + O(\bar{\varepsilon}^{2^n})$. for all $1 \le j \le m$. Hence, $A^j_n \to 0$ and $a^j_n \to 0$ exponentially fast as $n \to \infty$.
Moreover, the second part of Lemma 5.8 implies the following equation

$$
\big|\,[\,x + S_0^n(x, y, \mathbf{z})] - [\,v_*(x) + S_0^n(0, y, \mathbf{z})]\big| = O(\rho^n). \tag{5.19}
$$

Secondly, compare the first coordinates of (5.18) at $(0, y, z)$

$$
\begin{aligned}
&S_0^{n+1}(0, y, \mathbf{z}) \\
&= s_n(0, y, \mathbf{z})
\end{aligned}
$$

$$
\begin{aligned}
&+ \frac{1}{\alpha_n}\, S_0^n\Big(\alpha_n s_n(0,y,\mathbf{z}) + \sigma_n t_n y + \sigma_n \mathbf{u}_n \cdot (\mathbf{z} + \mathbf{r}_n(y)),\ \sigma_n y,\ \sigma_n \mathbf{d}_n y + \sigma_n(\mathbf{z} + \mathbf{r}_n(y))\Big) \\
&- \frac{1}{\alpha_n}\, \mathbf{u}_n \cdot \mathbf{R}_{n,\,0}(\sigma_n y).
\end{aligned}
$$

The estimation of $|\partial^2_{xy} S^n_k|$, $|\partial^2_{xz_i} S^n_k|$ and $|\partial^2_{yz_i} S^n_k|$, $|\partial^2_{z_i z_j} S^n_k|$ for $1 \leq i, j \leq m$ in Lemma 5.5 implies that

$$
\frac{\partial S_0^n}{\partial x}(0,y,\mathbf{z}) = O\Big(\sigma^n y + \sigma^n \sum_{j=1}^{m} z_j\Big) \quad \text{and} \quad \frac{\partial S_0^n}{\partial z_i}(0,y,\mathbf{z}) = O(y + z_i)
$$

respectively. Recall that the variable z_0 is the variable y. The order of the $t_n, \mathbf{u}_n, \mathbf{r}_n$ and Taylor's expansion of S_0^n at $(0, \sigma_n y, \sigma_n \mathbf{z})$ implies that

$$
\begin{aligned}
& S_0^{n+1}(0,y,\mathbf{z}) \\
&= s_n(0,y,\mathbf{z}) \\
&\quad + \frac{1}{\alpha_n}\bigg[S_0^n(0,\, \sigma_n y,\, \sigma_n \mathbf{z}) + \frac{\partial S_0^n}{\partial x}(0,\, \sigma_n y,\, \sigma_n \mathbf{z}) \cdot \Big(\alpha_n s_n(0,y,\mathbf{z}) + \sigma_n t_n y + \sigma_n \mathbf{u}_n \cdot (\mathbf{z} + \mathbf{r}_n(y))\Big) \\
&\quad + \sum_{j=1}^{m} \frac{\partial S_0^n}{\partial z_j}(0,\, \sigma_n y,\, \sigma_n \mathbf{z}) \cdot \Big(\sigma_n d_n^j\, y + \sigma_n r_n^j(y)\Big)\bigg] - \frac{1}{\alpha_n}\, \mathbf{u}_n \cdot \mathbf{R}_{n,\,0}(\sigma_n y) + O\Big(\bar{\varepsilon}^{2^n} \sum_{0 \leq i,\, j,\, k \leq m} z_i z_j z_k\Big) \\
&= \frac{1}{\alpha_n}\, S_0^n(0,\, \sigma_n y,\, \sigma_n \mathbf{z}) + \sum_{0 \leq i,j \leq m} e_{n,\,ij}\, z_i z_j + O\Big(\bar{\varepsilon}^{2^n} \sum_{0 \leq i,\, j,\, k \leq m} z_i z_j z_k\Big)
\end{aligned}
$$

where $e_{n,\,ij} = O(\bar{\varepsilon}^{2^n})$ for all $0 \leq i, j \leq m$. Then we can express $S_0^n(0,y,\mathbf{z})$ as the quadratic and higher order terms,

$$
S_0^n(0,y,\mathbf{z}) = \sum_{0 \leq i,\, j \leq m} a_{n,\,ij}\, z_i z_j + A_n(y,\mathbf{z}) \cdot \Big(\sum_{0 \leq i,\, j,\, k \leq m} z_i z_j z_k\Big).
$$

The recursive formula for $S_0^n(0,y,z)$ implies that

$$
\begin{aligned}
& S_0^{n+1}(0,y,\mathbf{z}) \\
&= \frac{1}{\alpha_n}\bigg[\sum_{0 \leq i,j \leq m} a_{n,\,ij}\, (\sigma_n z_i)(\sigma_n z_j) + A_n(\sigma_n y, \sigma_n \mathbf{z}) \cdot \Big(\sum_{0 \leq i,\, j,\, k \leq m} (\sigma_n z_i)(\sigma_n z_j)(\sigma_n z_k)\Big)\bigg] \\
&\quad + \sum_{0 \leq i,\, j \leq m} e_{n,\,ij}\, z_i\, z_j + O\Big(\bar{\varepsilon}^{2^n} \sum_{0 \leq i,\, j,\, k \leq m} z_i\, z_j\, z_k\Big).
\end{aligned}
$$

Hence, $a_{n+1,\,ij} = \dfrac{\sigma^2}{\alpha_n}\, a_{n,\,ij} + \displaystyle\sum_{0 \leq i,j \leq m} e_{n,\,ij}$ for $0 \leq i, j \leq m$ and moreover,

$$
\|A_{n+1}\| \leq \|A_n\| \cdot \frac{|\sigma_n|^3}{|\alpha_n|} + O(\bar{\varepsilon}^{2^n}).
$$

It implies that $a_{n,\,ij} \to a_{F,\,ij}$ for $0 \leq i, j \leq m$ and $\|A_n\| \to 0$ exponentially fast as $n \to \infty$. The exponential convergence of $S_0^n(0,y,\mathbf{z})$ to the quadratic function of y and $\mathbf{z}$ and the equation (5.19) show the asymptotic of $S_0^n(x,y,\mathbf{z})$. □

5.5. Universality of $\operatorname{Jac} R^n F$**.** Let the n^{th} renormalized map of F be $R^n F \equiv F_n = (f_n - \varepsilon_n,\ x,\ \boldsymbol{\delta}_n)$. Recall that $\Psi^n_{\text{tip}} \equiv \Psi^n_{\mathbf{v}}$ from n^{th} level to 0^{th} level and the tip τ_F is contained in $\in B^n_{v^n}$ for all $n \in \mathbb{N}$. Thus Ψ^n_{tip} is the original coordinate change rather than the normalized function $\Psi^n_{\mathbf{v}}$ conjugated by translations T_n.
Recall the equation (5.1) again

$$\begin{aligned}\operatorname{Jac} F_n(w) &= \operatorname{Jac} F^{2^n}(\Psi^n_{\text{tip}}(w)) \frac{\operatorname{Jac} \Psi^n_{\text{tip}}(w)}{\operatorname{Jac} \Psi^n_{\text{tip}}(F_n w)} \\ &= b^{2^n} \frac{\operatorname{Jac} \Psi^n_{\text{tip}}(w)}{\operatorname{Jac} \Psi^n_{\text{tip}}(F_n w)} (1 + O(\rho^n)).\end{aligned}$$

Theorem 5.10 (Universal expression of Jacobian determinant)**.** *For the function $F \in \mathcal{I}(\bar{\varepsilon})$ for sufficiently small $\bar{\varepsilon} > 0$, we obtain that*

$$\operatorname{Jac} F_n = b^{2^n} a(x)\,(1 + O(\rho^n))$$

where b is the average Jacobian of F and $a(x)$ is the universal positive function for some $\rho \in (0,1)$.

Proof. For the higher dimensional Hénon-like map, Lemma 5.8 and Lemma 5.9 are the essentially same as for the two dimensional Hénon-like maps. Then the proof of theorem is also the same as two dimensional nmaps. See Universality theorem in [CLM]. ☐

6. Toy model Hénon-like map in higher dimension

Let higher dimensional Hénon-like map satisfying $\varepsilon(w) = \varepsilon(x,y)$, that is, $\partial_{z_i}\varepsilon \equiv 0$ for all $1 \le i \le m$ be the *toy model map.* Denote the toy model map by F_{mod}. Then the projected map $\pi_{xy} \circ F_{\text{mod}} = F_{2d}$ is exactly two dimensional Hénon-like map. Let the horizontal-like diffeomorphism of F_{mod} be H_{mod}. Thus we see that $\pi_{xy} \circ H_{\text{mod}} = H_{2d}$. Then we obtain that $\pi_{xy} \circ RF_{\text{mod}} = RF_{2d}$.

Proposition 6.1. *Let $F_{\text{mod}} = (f(x) - \varepsilon(x,y),\ x,\ \boldsymbol{\delta}(w))$ be a toy model map in $\mathcal{I}(\bar{\varepsilon})$. Then n^{th} renormalized map $R^n F_{\text{mod}}$ is a toy model map, that is,*

$$\pi_{xy} \circ R^n F_{\text{mod}} = R^n F_{2d}$$

for every $n \in \mathbb{N}$. Moreover, ε_n is of the following form

$$\varepsilon_n(w) = \ b_1^{2^n} a(x) y (1 + O(\rho^n))$$

where b_1 is the average Jacobian of the two dimensional map, $F_{2d} = \pi_{xy} \circ F_{\text{mod}}$ and $a(x)$ is the non vanishing diffeomorphism on $\pi_x(B)$.

6.1. Tangent bundle splitting under DF_{mod}. Let DF and $D\delta$ be the Fréchet derivative of F and δ respectively. For the given point $w = (x,\, y,\, \mathbf{z})$, let us denote $w_i = (x_i,\, y_i,\, \mathbf{z}_i) = F^i(x,\, y,\, \mathbf{z})$. The (Fréchet) derivative of F has the block matrix form

$$DF_{\text{mod}} = \left(\begin{array}{cc|c} \multicolumn{2}{c|}{\multirow{2}{*}{DF_{2d}}} & \mathbf{0} \\ & & \mathbf{0} \\ \hline \partial_x\boldsymbol{\delta} & \partial_y\boldsymbol{\delta} & \partial_{\mathbf{z}}\boldsymbol{\delta} \end{array}\right)$$

where $\partial_{\mathbf{z}}\boldsymbol{\delta}$ is the $m \times m$ block matrix

$$\begin{pmatrix} \partial_{z_1}\delta^1 & \partial_{z_2}\delta^1 & \cdots & \partial_{z_m}\delta^1 \\ \partial_{z_1}\delta^2 & \partial_{z_2}\delta^2 & \cdots & \partial_{z_m}\delta^2 \\ \vdots & \vdots & \ddots & \vdots \\ \partial_{z_1}\delta^m & \partial_{z_2}\delta^m & \cdots & \partial_{z_m}\delta^m \end{pmatrix}$$

The Lemmas in this section using block matrices are due to the same notions in [Nam1] because the construction of invariant cone field could be applied to the object of any finite dimension. In the below we use the same notations in [Nam1].

$$DF_{\text{mod}}(x,y,\mathbf{z}) = \begin{pmatrix} A(w) & \mathbf{0} \\ C(w) & D(w) \end{pmatrix} \equiv \begin{pmatrix} A_1 & \mathbf{0} \\ C_1 & D_1 \end{pmatrix}. \tag{6.1}$$

where $A_w = DF_{2d}(x,y)$, $\mathbf{0} = \left(\begin{smallmatrix} \mathbf{0} \\ \mathbf{0} \end{smallmatrix}\right)$, $C_w = (\partial_x\boldsymbol{\delta}(w)\;\; \partial_y\boldsymbol{\delta}(w))$ and $D_w = \partial_{\mathbf{z}}\boldsymbol{\delta}(w)$. Since we assume that F_{mod} and F_{2d} are diffeomorphisms, DF_{mod} and A_w are invertible. It implies that D_w is invertible at each w. Let w_N be $F^N(w)$ and the derivative of the N^{th} iterated map F^N_{mod} be DF^N_{mod}. Denote DF^N_{mod} as the block matrix form as follows

$$DF^N_{\text{mod}}(x,y,\mathbf{z}) = \begin{pmatrix} A_N(w) & \mathbf{0} \\ C_N(w) & D_N(w) \end{pmatrix} \equiv \begin{pmatrix} A_N & \mathbf{0} \\ C_N & D_N \end{pmatrix}. \tag{6.2}$$

Then for each $N \geq 1$,

$$\begin{pmatrix} A_N & \mathbf{0} \\ C_N & D_N \end{pmatrix} = \begin{pmatrix} A_1(w_{N-1}) & \mathbf{0} \\ C_1(w_{N-1}) & D_1(w_{N-1}) \end{pmatrix} \cdot \begin{pmatrix} A_{N-1} & \mathbf{0} \\ C_{N-1} & D_{N-1} \end{pmatrix}.$$

Let $A_0 \equiv 1$, $C_0 \equiv 1$, $D_0 \equiv 1$ and $w = w_0$ for notational compatibility. Then by direct calculations, we obtain

$$\begin{aligned} A_N &= A_1(w_{N-1})\, A_{N-1} = \prod_{i=0}^{N-1} A_1(w_{N-i-1}) \\ D_N &= D_1(w_{N-1})\, D_{N-1} = \prod_{i=0}^{N-1} D_1(w_{N-i-1}) \\ C_N &= C_1(w_{N-1})\, A_{N-1} + D_1(w_{N-1})\, C_{N-1} \\ &= \sum_{i=0}^{N-1} D_i(w_{N-1-i})\, C_1(w_{N-1-i})\, A_{N-1-i}. \end{aligned} \tag{6.3}$$

We see that $[DF^N_{\text{mod}}(w)]^{-1} = DF^{-N}_{\text{mod}}(F^N(w))$ by inverse function theorem. Thus using block matrix expressions, $[DF^N_{\rm mod}(w)]^{-1}$ is

$$DF^{-N}_{\rm mod} = \begin{pmatrix} A_N^{-1} & \mathbf{0} \\ -D_N^{-1}\, C_N\, A_N^{-1} & D_N^{-1} \end{pmatrix} \tag{6.4}$$

at the point, $F^N(w)$.

Let the cone at w with some positive number γ to be

$$\mathcal{C}(\gamma)_w = \{ u + v \mid u \in \mathbb{R}^2 \times \{\mathbf{0}\},\ v \in \{\mathbf{0}\} \times \mathbb{R}^m \ \text{ and } \ \frac{1}{\gamma}\, \|u\| > \|v\| \,\}. \tag{6.5}$$

The cone field over a given compact invariant set Γ is the union of the cones at every points in Γ

$$\mathcal{C}(\gamma) = \bigcup_{w \in \Gamma} \mathcal{C}(\gamma)_w. \tag{6.6}$$

Let $\|DF\|$ be the operator norm of DF. [4] The minimum expansion rate (or the strongest contraction rate) of DF is defined by the equation, $\|DF^{-1}\| = \dfrac{1}{m(DF)}$.

Lemma 6.2. *Let A_N, $\mathbf{0}$, C_N and D_N be components of $DF^N_{\rm mod}$ defined on (6.2). Suppose that $\|D_1\| < m(A_1)$. Then $\|\, C_N\, A_N^{-1} \| < \kappa$ for some $\kappa > 0$ independent of N.*

Proof. See Lemma 7.2 in [Nam1]. □

Lemma 6.3. *Let $F_{\rm mod} \in \mathcal{I}(\bar\varepsilon)$ with small enough $\bar\varepsilon > 0$. Suppose that $\|D_1\| \leq \frac{\rho}{2} \cdot m(A_1)$ for some $\rho \in (0,1)$. Let $\mathcal{C}(\gamma)$ over the given compact invariant set Γ be the cone field which is defined on (6.6) with cones in (6.5). Then $\mathcal{C}(\gamma)$ is invariant under $DF^{-1}_{\rm mod}$ for all sufficiently small $\gamma > 0$. More precisely, any given invariant compact set Γ has the dominated splitting.*

Proof. See Lemma 7.3 in [Nam1]. □

Remark 6.1. In Lemma 6.2, components of matrix form, A_1, D_1, A_N and D_N depends on each point $w \in \Gamma$. Then $\dfrac{\|D_1(w)\|}{m(A_1(w))} \leq \dfrac{1}{2}\,\rho_w$ for some positive $\rho_w < 1$. Then the actual assumption is that the set of $\rho_w > 0$ for $w \in \Gamma$ is totally bounded above by the number less than $\frac{1}{2}$. However, since Γ is compact, $\{\, \rho_w \mid w \in \Gamma \,\}$ is the precompact set. Then ρ can be chosen as the supremum of $\{\, \rho_w \mid w \in \Gamma \,\}$. Then κ in Lemma 6.2 is independent of $w \in \Gamma$. Thus κ is also uniform number independent of w. Moreover, the cone field $\mathcal{C}(\gamma)$ in Lemma 6.3 is contracted in uniform rate by DF^{-1}.

---

[4] The operator norm is defined on the linear operator at each point. For example,

$$\|DF_w\| = \sup_{\|v\|=1} \{ \|DF_w v\| \}$$

The value $\|DF\|$ is defines as $\sup_{w \in B} \|DF_w\|$.

6.2. Tangent bundle splitting under a small perturbation of toy model map. The existence of the invariant cone field under DF_{mod} is still true when a small perturbation of DF_{mod} is chosen. Let us consider the block diagonal matrix form of DF. Let the following map be a *perturbation* of the toy model map, $F_{\text{mod}}(w) = (f(x) - \varepsilon_{2d}(x,y),\ x,\ \boldsymbol{\delta}(w))$

$$F(w) = (f(x) - \varepsilon_{2d}(x,y) - \widetilde{\varepsilon}(w),\ x,\ \boldsymbol{\delta}(w)) \tag{6.7}$$

where $\varepsilon(w) = \varepsilon_{2d}(x,y) + \widetilde{\varepsilon}(w)$. Thus $\partial_z\varepsilon(w) = \partial_z\widetilde{\varepsilon}(w)$.

$$DF = \left(\begin{array}{cc|c} \multicolumn{2}{c|}{D\widetilde{F}_{2d}} & \partial_{\mathbf{z}}\varepsilon \\ & & \mathbf{0} \\ \hline \partial_x\boldsymbol{\delta} & \partial_y\boldsymbol{\delta} & \partial_{\mathbf{z}}\boldsymbol{\delta} \end{array}\right) = \left(\begin{array}{c|c} A & B \\ \hline C & D \end{array}\right) \tag{6.8}$$

where $D\widetilde{F}_{2d} = \begin{pmatrix} f'(x) - \partial_x\varepsilon(w) & -\partial_y\varepsilon(w) \\ 1 & 0 \end{pmatrix}$ and $\partial_{\mathbf{z}}\varepsilon$ is the row vector $(\partial_{z_1}\varepsilon\ \ \partial_{z_2}\varepsilon\ \ \ldots\ \ \partial_{z_m}\varepsilon)$. If $B \equiv \mathbf{0}$, then F is F_{mod}. [5]

Lemma 6.4. *Let F be a perturbation of the toy model map F_{mod} defined in* (6.7) *and A, B, C and D are components of block matrix form of DF defined in* (6.8). *Suppose that $\|D_1\| \leq \frac{\rho_1}{2} \cdot m(A_1)$ for some $\rho_1 \in (0,1)$. Suppose also that $\|B\|\|C\| \leq \rho_0 \cdot m(A) \cdot m(D)$ where $\rho_0 < \frac{\kappa\gamma}{2}$ for sufficiently small $\gamma > 0$. Then the cone field $\mathcal{C}(\gamma)$ defined on* (6.6) *is invariant under DF^{-1} .*

Proof. See Lemma 7.4 in [Nam1]. ☐

Then the tangent space $T_\Gamma B$ of DF has the splitting of the invariant subbundles $E^1 \oplus E^2$ such that

(1) $T_\Gamma B = E^1 \oplus E^2$.

(2) Both E^1 and E^2 are invariant under DF.

(3) $\|DF^n|_{E^1(x)}\|\|DF^{-n}|_{E^2(F^{-n}(x))}\| \leq C\mu^n$ for some $C > 0$ and $0 < \mu < 1$ and $n \geq 1$.

Thus $T_\Gamma B$ is *dominated* over the compact invariant set Γ. Moreover, the dominated splitting implies that invariant sections $w \mapsto E^1(w)$ and $w \mapsto E^2(w)$ are continuous by Theorem 1.2 in [**?**]. Then the maps, $w \mapsto E^i(w)$ for $i = 1, 2$ are continuous.

---

[5] If the bounded operator T has $\|T\| < 1$, then $\operatorname{Id} - T$ is invertible. Moreover,

$$(\operatorname{Id} - T)^{-1} = \sum_{n=0}^{\infty} T^n$$

Since, $\|T^n\| \leq \|T\|^n$ for every $n \in \mathbb{N}$, $\|(\operatorname{Id} - T)^{-1}\| \leq \dfrac{1}{1 - \|T\|}$. Equivalently, we get the lower bound of the minimum expansion rate, $m(\operatorname{Id} - T) \geq 1 - \|T\|$.

7. Single invariant surfaces

7.1. Invariant surfaces and two dimensional ambient space. Let us consider dominated splitting of DF over the given compact set. One of the subbundle, for instance, E^{ss} is uniformly contracted under $DF|_{E^{ss}}$. If there exists an invariant submanifold whose codimension is at least one such that this manifold is tangent to invariant tangent subbundle and it contains the invariant compact set, then we expect the dynamics is reduced in this invariant manifold.

Definition 7.1. A C^r submanifold Q which contains Γ is *locally invariant* under f if there exists a neighborhood U of Γ in Q such that $f(U) \subset Q$.

The necessary and sufficient condition for the existence of these submanifolds, see [CP] and its references.

Theorem 7.1 ([CP])**.** *Let Γ be an invariant compact set with a dominated splitting $T_\Gamma M = E^1 \oplus E^2$ such that E^1 is uniformly contracted. Then Γ is contained in a locally invariant submanifold tangent to E^2 if and only if the strong stable leaves for the bundle E^1 intersect the set Γ at only one point.*

Moreover, the existence of invariant submanifold is robust under C^1 perturbation.

Proposition 7.2 ([CP])**.** *Let Γ be an invariant compact set with a dominated splitting $E^1 \oplus E^2$ such that E^1 is uniformly contracted. If Γ is contained in a locally invariant submanifold tangent to E^2, then the same holds for any diffeomorphism C^1close to f and any compact set Γ' contained in a small neighborhood of Γ.*

Let us consider the toy model map which is infinitely renormalizable. Recall that DF_{mod} be $\left(\begin{smallmatrix} A & \mathbf{0} \\ C & D \end{smallmatrix}\right)$ where A is the derivative of $\pi_{xy} \circ F_{\mathrm{mod}}$. For a given invariant compact set, let us assume that Γ has the dominated splitting $T_\Gamma B = E^{ss} \oplus E^{pu}$ where $DF|_{E^{ss}}$ is D, $DF|_{E^{pu}}$ is A and $\|D\|\|A^{-1}\| < \rho < 1$. Let $W^{ss}(w)$ be the strong stable manifold which is tangent to $E^{ss}(w)$ for each $w \in \Gamma$. A pseudo unstable manifold, $W^{pu}(w)$ is defined similarly. Observe that $W^{pu}(w)$ is two dimensional manifold at every point $w \in \Gamma$.

Lemma 7.3 (Lemma A.1 and Lemma A.2 in [Nam3])**.** *Let F be an infinitely renormalizable Hénon-like map. Then the critical Cantor set, $\mathcal{O}_F$ is the set of accumulation points of Per_F. Moreover, $W^s(w) \cap \overline{\mathrm{Per}}_F = \{w\}$ for every point $w \in \overline{\mathrm{Per}}_F$.*

The toy model map has invariant set of codimension two hyperplane under F

$$\bigcup_{(x,y)\in I^x \times I^y} \{(x, y, \mathbf{z}) \mid \mathbf{z} \in I^{\mathbf{z}}\} \tag{7.1}$$

where $I^{\mathbf{z}} = I^{z_1} \times I^{z_2} \times \cdots \times I^{z_m}$. Moreover, any vector which perpendicular to $xy-$plane is invariant under DF_{mod} up to the size. Then by Theorem 7.1 and Lemma 7.1 implies the following lemma.

Lemma 7.4. *Let F_{mod} be the toy model map in $\mathcal{I}(\bar{\varepsilon})$. Suppose that*

$$\sup_{w \in \overline{\mathrm{Per}}_{F_{\mathrm{mod}}}} \frac{\|D_1(w)\|}{m(A_1(w))\|} \leq \frac{1}{2}$$

where A_1 and D_1 are the block matrix in (6.1)*. Then there exists a locally invariant C^1 single surface Q which contains $\overline{\mathrm{Per}}_{F_{\mathrm{mod}}}$. The surface Q meets transversally and uniquely strong stable manifold, W^{ss} at each $w \in \overline{\mathrm{Per}}_{F_{\mathrm{mod}}}$.*

Proof. Lemma 6.3 implies the dominated splitting over $\overline{\mathrm{Per}}_{F_{\mathrm{mod}}}$. This dominated splitting implies that the hyperplanes in (7.1) at each point w of $\overline{\mathrm{Per}}_{F_{\mathrm{mod}}}$ is the strong stable manifold at w. Transversal intersection of invariant cone fields implies that the surface Q tangent to E^{pu} over $\overline{\mathrm{Per}}_{F_{\mathrm{mod}}}$ meets transversally each $W^{ss}(w)$. We may assume that Q is locally invariant by Theorem 7.1. Let us show the uniqueness of the intersection point. Suppose that w and w' are points in $Q \cap W^{ss}(w)$. If $w \neq w'$, then $w' \notin \overline{\mathrm{Per}}_{F_{\mathrm{mod}}}$ by Lemma 7.3. Take a small neighborhood U of w' in the invariant surface Q. Then U converges to the neighborhood of $F^n(w)$ in Q as $n \to \infty$ by Inclination Lemma. Thus Q cannot be a submanifold of the ambient space because it accumulates itself. This contradicts to Theorem 7.1. Hence, w is the unique intersection point. □

Let $F_{\mathrm{mod}} \in \mathcal{I}(\bar{\varepsilon})$ which is sectionally dissipative at fixed points. Recall that the invariant plane field, E^{pu} over $\overline{\mathrm{Per}}_{F_{\mathrm{mod}}}$ is two dimensional. Thus E^{pu} contains the unstable direction at every periodic points. Then the invariant surface Q tangent to E^{pu} contains the set

$$\mathcal{A} \equiv \mathcal{O} \cup \bigcup_{n \geq 0} W^u(\mathrm{Orb}(q_n))$$

where each q_n is the periodic point with period 2^n. The set $\mathcal{A}$ is called the *global attracting set.*

7.2. Invariant surfaces containing $\overline{\mathrm{Per}}$ as the graph of C^r map. Recall b_1 be the average Jacobian of $F_{2d} \equiv \pi_{xy} \circ F_{\mathrm{mod}}$. Suppose that $\|\partial_{\mathbf{z}} \boldsymbol{\delta}\| \leq \rho \cdot m(F_{2d})$ for some $\rho < 1$ with dominated splitting over $\overline{\mathrm{Per}}_{F_{\mathrm{mod}}}$. Denote $\overline{\mathrm{Per}}_{F_{\mathrm{mod}}}$ by Γ. Then there exists a locally invariant single surface which contains $\mathcal{A}_{F_{\mathrm{mod}}}$. The set of $m-$dimensional hyperplanes which are perpendicular to $xy-$plane

$$\bigcup_{(x,\,y) \in\, \pi_{xy}(B)} \{(x,\, y,\, \mathbf{z}) \mid \mathbf{z} \in I^{\mathbf{z}}\}$$

is invariant under F_{mod}. Since tangent subbundle E^{ss} for DF_{mod} is constant and strong stable manifold is unique at each point in Γ, the above set contains the strong stable foliation over Γ. The angle between each tangent spaces E^{ss}_w and E^{pu}_w is (uniformly) positive. Thus the maximal angle between E^{pu} and $T\mathbb{R}^2$ is less than $\frac{\pi}{2}$.

Remark 7.1. If $T_\Gamma B = E^{ss} \oplus E^{pu}$ is $r-$dominated splitting, then Q which is invariant single surface tangent to E^{pu} is a C^r surface. Moreover, since the strong stable manifolds at each point is the set of perpendicular lines to $xy-$plane, Q is the graph of C^r function from a region in $I^x \times I^y$ to $I^{\mathbf{z}}$.

We may assume that invariant surfaces tangent to the invariant plane field has the neighborhood, say also Q, of the tip, $\tau_{F_{\mathrm{mod}}}$ in the given invariant single surface which satisfies the following properties by Lemma 7.4.

(1) Q is contractible.

(2) Q contains $\tau_{F_{\rm mod}}$ in its interior and is locally invariant under F^{2^N} for big enough $N \in \mathbb{N}$.

(3) Topological closure of Q is the graph of C^r map from a neighborhood of $\tau\big(\pi_{xy} \circ F_{\rm mod}\big)$ in $xy-$plane to I^z.

By C^1 robustness of the existence of single invariant surfaces, if F be a *sufficiently small perturbation* of $F_{\rm mod}$, then there exist invariant surfaces each of which is the graph of C^r map from a region in the $xy-$plane to I^z.

There exists an invariant surface Q under F on $\pi_{xy}(B^n_0)$ as the graph of the C^r function ξ with $\|D\xi\| \leq C\bar{\varepsilon}$ only if there exists the dominated splitting in the previous subsection. Then the image of Q under the map $\big(\Psi^n_{\rm tip}\big)^{-1}$ is also an invariant surface under R^nF for every big enough $n \in \mathbb{N}$ (See Lemma 7.6 below). The existence is based on the global implicit function theorem in [ZG].

Theorem 7.5 (Theorem 1 in [ZG]). *Let $f : \mathbb{R}^n \times \mathbb{R}^m \longrightarrow \mathbb{R}^m$ is continuous mapping and it is continously differentiable for second variable $u \in \mathbb{R}^m$. Suppose that*

$$\left|\left[\frac{\partial}{\partial u}\, f(x,u)\right]_{ii}\right| - \sum_{i\neq j}\left|\left[\frac{\partial}{\partial u}\, f(x,u)\right]_{ij}\right| \geq d > 0$$

for all $(x,u) \in \mathbb{R}^n \times \mathbb{R}^m$ and $i = 1,2,\ldots,m$ where $\big[\frac{\partial}{\partial u}\, f(x,u)\big]_{ij}$ is the ij entry of the Jacobian matrix of f over the second variable u. Then there exists the unique mapping $g \colon R^n \to \mathbb{R}^m$ such that $f(x,g(x)) = 0$. Moreover, g is continuous. If f is continuously differentiable, then so is g.

Proposition 7.6. *Let $F \in \mathcal{I}(\bar{\varepsilon})$ and Q be an invariant surface under F, which is the graph of C^r function $\boldsymbol{\xi} = (\xi^1, \xi^2, \ldots, \xi^m)$ on $\pi_{xy}(B^n_{\rm tip})$ such that $\|D\boldsymbol{\xi}\| \leq C_0\,\bar{\varepsilon}$ for some $C_0 > 0$. Then $Q_n \equiv \big(\Psi^n_{\rm tip}\big)^{-1}(Q)$ is an invariant surface under R^nF which is the graph of $\boldsymbol{\xi}_n = (\xi^1_n, \xi^2_n, \ldots, \xi^m_n) : \pi_{xy}\big(B(R^nF)\big) \to \pi_{\mathbf{z}}\big(B(R^nF)\big)$ such that*

$$\boldsymbol{\xi}_n(x,y) = \mathbf{c}y(1 + O(\rho^n))$$

where $\mathbf{c} = (c_1, c_2, \ldots, c_m)$ for some constants c_i for $1 \leq i \leq m$.

Proof. The n^{th} renormalization of F, R^nF is $\big(\Psi^n_{\rm tip}\big)^{-1} \circ F^{2^n} \circ \Psi^n_{\rm tip}$. Thus $Q_n \equiv \big(\Psi^n_{\rm tip}\big)^{-1}(Q)$ is an invariant surface under R^nF. Let us choose a point $w' = (x', y', \mathbf{z}') \in Q \cap B^n_{\rm tip}$ where $B^n_{\rm tip} \equiv \Psi^n_{\rm tip}(B(R^nF))$ and $\mathbf{z}' = \boldsymbol{\xi}(x',y')$ where $\boldsymbol{\xi}(x',y') = \big(\xi^1(x',y'),\, \xi^2(x',y'),\, \ldots, \xi^m(x',y')\big)$. Thus

$$\text{graph}(\boldsymbol{\xi}) = (x',\, y',\, \boldsymbol{\xi}(x',y')) = (x',\, y',\, \mathbf{z}').$$

Moreover, let $\big(\Psi^n_{\rm tip}\big)^{-1}(x',\, y',\, \mathbf{z}') = (x,\, y,\, \mathbf{z}) \in Q_n$. Thus by equation (5.14), each coordinates of $\Psi^n_{\rm tip}$ as follows

$$x' = \alpha_{n,0}(x + S^n_0(w)) + \sigma_{n,0}\, t_{n,0} \cdot y + \sigma_{n,0}\, \mathbf{u}_{n,0} \cdot (\mathbf{z} + \mathbf{R}_{n,0}(y)) \tag{7.2}$$

$$y' = \sigma_{n,0} \cdot y \tag{7.3}$$

$$\mathbf{z}' = \sigma_{n,0}\, \mathbf{d}_{n,0} \cdot y + \sigma_{n,0}\, (\mathbf{z} + \mathbf{R}_{n,0}(y)) \tag{7.4}$$

where $w = (x,\, y,\, \mathbf{z})$. Let us show that Q_n is the graph of a well defined function $\boldsymbol{\xi}_n = (\xi^1_n,\, \xi^2_n, \dots, \xi^m_n)$ from $\pi_{xy}(B(R^nF))$ to $\pi_{\mathbf{z}}(B(R^nF))$, that is, $z_i = \xi^i_n(x,\, y)$ for $1 \leq i \leq m$. By the equations (7.3) and (7.4), we see that

$$\begin{aligned}\sigma_{n,\,0} \cdot \mathbf{z} &= \mathbf{z}' - \sigma_{n,\,0}\, \mathbf{d}_{n,\,0} \cdot y - \sigma_{n,\,0}\, \mathbf{R}_{n,\,0}(y) \\ &= \boldsymbol{\xi}(x',\, y') - \sigma_{n,\,0}\, \mathbf{d}_{n,\,0} \cdot y - \sigma_{n,\,0}\, \mathbf{R}_{n,\,0}(y) \\ &= \boldsymbol{\xi} \circ \big(\alpha_{n,0}(x + S^n_0(w)) + \sigma_{n,\,0}\, t_{n,\,0} \cdot y + \sigma_{n,\,0}\, \mathbf{u}_{n,\,0} \cdot (\mathbf{z} + \mathbf{R}_{n,\,0}(y)),\ \sigma_{n,\,0}\, y\big) \\ &\qquad - \sigma_{n,\,0}\, \mathbf{d}_{n,\,0} \cdot y - \sigma_{n,\,0}\, \mathbf{R}_{n,\,0}(y).\end{aligned} \tag{7.5}$$

Let us show the existence of the solution of (7.5) for $\mathbf{z}$. Define the function $\mathbf{G}_n$ from B to $\pi_{\mathbf{z}}(B)$. Each coordinate function G^i_n of $\mathbf{G}_n$ is

$$\begin{aligned}G^i_n(x, y, \mathbf{z}) = \xi^i &\circ \big(\alpha_{n,0}(x + S^n_0(w)) + \sigma_{n,\,0}\, t_{n,\,0} \cdot y + \sigma_{n,\,0}\, \mathbf{u}_{n,\,0} \cdot (\mathbf{z} + \mathbf{R}_{n,\,0}(y)),\ \sigma_{n,\,0}\, y\big) \\ &- \sigma_{n,\,0}\, d^i_{n,\,0} \cdot y - \sigma_{n,\,0}\, R^i_{n,\,0}(y) - \sigma_{n,\,0} \cdot z_i.\end{aligned}$$

where $\mathbf{z} = (z_1, z_2, \dots, z_m)$ for $1 \leq i \leq m$. Then the partial derivative of G^i_n over z_j is as follows

$$\begin{aligned}\partial_{z_j} G^i_n(x, y, \mathbf{z}) = \partial_x \xi^i &\circ \big(\alpha_{n,0}(x + S^n_0(w)) + \sigma_{n,\,0}\, t_{n,\,0} \cdot y + \sigma_{n,\,0}\, \mathbf{u}_{n,\,0} \cdot (\mathbf{z} + \mathbf{R}_{n,\,0}(y)),\ \sigma_{n,\,0} \cdot y\big) \\ &\cdot \big[\, \alpha_{n,\,0} \cdot \partial_{z_j} S^n_0(w) + u^j_{n,\,0}\, \sigma_{n,\,0} \,\big]\end{aligned}$$

for $i \neq j$. Moreover, if $i = j$, then

$$\begin{aligned}\partial_{z_i} G^i_n(x, y, \mathbf{z}) = \partial_x \xi^i &\circ \big(\alpha_{n,0}(x + S^n_0(w)) + \sigma_{n,\,0}\, t_{n,\,0} \cdot y + \sigma_{n,\,0}\, \mathbf{u}_{n,\,0} \cdot (\mathbf{z} + \mathbf{R}_{n,\,0}(y)),\ \sigma_{n,\,0} \cdot y\big) \\ &\cdot \big[\, \alpha_{n,\,0} \cdot \partial_{z_i} S^n_0(w) + u^i_{n,\,0}\, \sigma_{n,\,0} \,\big] - \sigma_{n,\,0}\end{aligned}$$

Recall that $\alpha_{n,\,0} = \sigma^{2n}(1 + O(\rho^n))$, $\sigma_{n,\,0} = (-\sigma)^n(1 + O(\rho^n))$, $\|\partial_{z_j} S^n_0\| = O\big(\bar\varepsilon\big)$ and $|u^j_{n,0}| = O\big(\bar\varepsilon\big)$ for all $1 \leq j \leq m$. Then for $m \geq 2$,

$$\|\partial_{z_j} G^i_n\| \leq \|\partial_x \xi^i\| \cdot \big[\, \sigma^{2n} C_0\, \bar\varepsilon + \sigma^n C_1\, \bar\varepsilon \,\big]$$

for $i \neq j$ and for some positive numbers, C_0 and C_1. Recall that $\|\,\mathbf{u}_{n,\,0}\| \asymp \|\,\mathbf{u}_{1,\,0}\|$ by the equation (5.12) and $|\,u^j_{1,\,0}| \asymp |\,\partial_{z_j}\varepsilon|$ for each $1 \leq j \leq m$. Thus if small enough $\|\partial_{\mathbf{z}}\varepsilon\|$ is chosen for a small perturbation of the toy model map, then we may assume that

$$\|\,\mathbf{u}_{n,\,0}\| \cdot |\,\sigma_{n,\,0}| < \frac{1}{4Cm^2}\, \sigma^n$$

where the constant $C \geq \max_{1 \leq i \leq m} \|\partial_x \xi^i\|$. Then we may also assume that

$$\sum_{i \neq j} \|\,\partial_{z_j} G^i_n\| \leq \frac{1}{4}\, \sigma^n$$

However,

$$\min_{w \in B(R^nF)} |\,\partial_{z_i} G^i_n(w)| \geq \big|\, - \|\partial_x \xi^i\| \cdot \big[\, \sigma^{2n} C_0\, \bar\varepsilon + \sigma^n C_1\, \bar\varepsilon \,\big] + |\,\sigma_{n,\,0}| \,\big| \geq \frac{1}{2}\, \sigma^n$$

Let us consider the Jacobian matrix $\Big(\frac{\partial}{\partial z_j}\, G^i(x, y, \mathbf{z})\Big)_{ij}$ of $\mathbf{z}$ variables. Then the sum of absolute value of diagonal elements dominates the sum of all other elements for every big enough $n \in \mathbb{N}$. Then applying Theorem 7.5 to the map $\mathbf{G_n}$ for every sufficiently big $n \in \mathbb{N}$, there exists the C^r map $\boldsymbol{\xi}_n$ from $\pi_{xy}(B(R^nF))$ to $\mathbb{R}^m$. Furthermore, since each surface Q_n is contractible, the function $\boldsymbol{\xi}_n(x,y)$ is defined globally by the C^r continuation of coordinate charts.

Let us calculate the bounds of the norm $\|D\boldsymbol{\xi}_n(x,y)\|$. By (7.3) and (7.4) with chain rule, we obtain the following equations

$$\partial_x\boldsymbol{\xi} \cdot \frac{\partial x'}{\partial x} = \sigma_{n,\,0} \cdot \partial_x \boldsymbol{\xi}_n$$

$$\partial_x\boldsymbol{\xi} \cdot \frac{\partial x'}{\partial y} + \partial_y\boldsymbol{\xi} \cdot \sigma_{n,\,0} = \sigma_{n,\,0}\mathbf{d}_{n,\,0} + \sigma_{n,\,0} \cdot \partial_y\boldsymbol{\xi}_n + \sigma_{n,\,0} \cdot (\mathbf{R}_{n,\,0})'(y).$$

By the equation (7.2), each partial derivatives of ξ_n as follows

$$\begin{aligned}
\frac{\partial \boldsymbol{\xi}_n}{\partial x} &= \frac{1}{\sigma_{n,\,0}} \cdot \partial_x\boldsymbol{\xi} \cdot \left[\alpha_{n,\,0}\big(1 + \partial_x S^n_0(w)\big) + \sigma_{n,\,0} \sum_{j=1}^{m} u^j_{n,\,0} \cdot \frac{\partial \xi^j_n}{\partial x}\right] \\
\frac{\partial \boldsymbol{\xi}_n}{\partial y} &= \frac{1}{\sigma_{n,\,0}} \cdot \partial_x\boldsymbol{\xi} \cdot \left[\alpha_{n,\,0}\, \partial_y S^n_0(w) + \sigma_{n,\,0} t_{n,\,0} + \sigma_{n,\,0} \sum_{j=1}^{m} u^j_{n,\,0} \Big(\frac{\partial \xi^j_n}{\partial y} + (R^j_{n,\,0})'(y)\Big)\right] \\
&\quad + \partial_y\boldsymbol{\xi} - \mathbf{d}_{n,\,0} - (\mathbf{R}_{n,\,0})'(y).
\end{aligned} \tag{7.6}$$

Recall that $\sigma_{n,\,0} \asymp (-\sigma)^n$, $\alpha_{n,\,0} \asymp \sigma^{2n}$ for each $n \in N$. Thus

$$\left\|\frac{\partial \xi^i_n}{\partial x}\right\| \leq \ \|\partial_x\boldsymbol{\xi}\|\, C_0\sigma^n \leq C\bar{\varepsilon}\,\sigma^n$$

for some $C_0 > 0$. Recall also that $\|\partial_y S^n_0(w)\| \leq C_3\,\bar{\varepsilon}$ for some $C_3 > 0$ by Proposition 5.4 and moreover the values $t_{n,\,0}$, $\mathbf{u}_{n,\,0}$ and $\mathbf{d}_{n,\,0}$ converge super exponentially fast to $t_{*,\,0}$, $\mathbf{u}_{*,\,0}$ and $\mathbf{d}_{*,\,0}$ respectively as $n \to \infty$ by Lemma 5.3. Furthermore each partial derivatives $\partial_x\boldsymbol{\xi}(w)$ and $\partial_y\boldsymbol{\xi}(w)$ to the value of each partial derivatives at the origin exponentially fast as $n \to \infty$. We can show that $(\mathbf{R}_{n,0})'(y)$ converges to zero exponentially fast by the estimation of $\mathbf{R}_{n,\,0}$ in Lemma 5.9. With all of these facts we obtain that

$$\boldsymbol{\xi}_n(x,y) = \mathbf{c}y(1 + O(\rho^n))$$

where $\mathbf{c} = \dfrac{t_{*,\,0} \cdot \partial_x\boldsymbol{\xi}(\tau_F) + \partial_y\boldsymbol{\xi}(\tau_F) - \mathbf{d}_{*,\,0}}{1 - \mathbf{u}_{*,\,0} \cdot \partial_x\boldsymbol{\xi}(\tau_F)}$. In other words, each coordinate of $\mathbf{c}$ is

$$c_i = \frac{t_{*,\,0} \cdot \partial_x\xi^i(\tau_F) + \partial_y\xi^i(\tau_F) - d^i_{*,\,0}}{1 - \mathbf{u}_{*,\,0} \cdot \partial_x\boldsymbol{\xi}(\tau_F)}$$

where $\mathbf{c} = (c_1, c_2, \ldots, c_m)$ for $1 \leq i \leq m$. □

8. Universality of conjugated two dimensional C^r Hénon-like map

8.1. Renormalization of conjugated two dimensional Hénon-like map. Let $F \in \mathcal{I}(\bar{\varepsilon})$ be a small perturbation of toy model map $F_{\text{mod}} \in \mathcal{I}(\bar{\varepsilon})$. Let Q_n and Q_k be invariant surfaces under R^nF and R^kF respectively and assume that $k < n$. Then by Lemma 7.6, Ψ^n_k is the coordinate change map between $R^kF^{2^{n-k}}$ and R^nF from level n to k such that $\Psi^n_k(Q_n) \subset Q_k$. Let us define C^r two dimensional Hénon-like map ${}_{2d}F_{n,\,\boldsymbol{\xi}}$ on level n as follows

$$ {}_{2d}F_{n,\,\boldsymbol{\xi}} \equiv \pi^{\boldsymbol{\xi}_n}_{xy} \circ R^nF|_{Q_n} \circ (\pi^{\boldsymbol{\xi}_n}_{xy})^{-1} \tag{8.1} $$

where the map $(\pi^{\boldsymbol{\xi}_n}_{xy})^{-1} : (x, y) \mapsto (x,\, y,\, \boldsymbol{\xi}_n(x, y))$ is a C^r diffeomorphism on the domain of two dimensional map, $\pi_{xy}(B)$. In particular, the map $F_{2d,\,\boldsymbol{\xi}}$ is defined as follows

$$ F_{2d,\,\boldsymbol{\xi}}(x, y) = (f(x) - \varepsilon(x, y, \boldsymbol{\xi}),\, x) \tag{8.2} $$

where graph($\boldsymbol{\xi}$) is a C^r invariant surface under the $m+2$ dimensional map $F\colon (x, y, \mathbf{z}) \mapsto (f(x) - \varepsilon(x, y, \mathbf{z}),\ x,\ \boldsymbol{\delta}(x, y, \mathbf{z}))$. Let us assume that $2 \le r < \infty$. By Lemma 7.6, the invariant surfaces, Q_n and Q_k are the graph of C^r maps $\boldsymbol{\xi}_n(x, y)$ and $\boldsymbol{\xi}_k(x, y)$ respectively. Then we can apply techniques for two dimensional conjugated map in three dimension to the maps in $m+2$ dimension. All results in this and following section are the same as those of two dimensional Hénon-like maps by invariant surfaces in three dimension. See Section 4 and Section 5 in [Nam3].

The map ${}_{2d}\Psi^n_{k,\,\boldsymbol{\xi},\,\text{tip}}$ is defined as the map which satisfies the following commutative diagram

$$\begin{tikzcd}
(Q_n, \tau_n) \arrow[r, "\Psi^n_{k,\mathbf{v},\text{tip}}"] \arrow[d, "\pi^{\boldsymbol{\xi}_n}_{xy,\,n}"'] & (Q_k, \tau_k) \arrow[d, "\pi^{\boldsymbol{\xi}_k}_{xy,\,k}"] \\
({}_{2d}B_n, \tau_{2d,\,n}) \arrow[r, "{}_{2d}\Psi^n_{k,\,\boldsymbol{\xi},\text{tip}}"] & ({}_{2d}B_k, \tau_{2d,\,k})
\end{tikzcd}$$

where Q_n and Q_k are invariant C^r surfaces with $2 \le r < \infty$ of R^nF and R^kF respectively and $\pi^{\boldsymbol{\xi}_n}_{xy,\,n}$ and $\pi^{\boldsymbol{\xi}_k}_{xy,\,k}$ are the inverse of the graph maps, $(x, y) \mapsto (x, y, \boldsymbol{\xi}_n)$ and $(x, y) \mapsto (x, y, \boldsymbol{\xi}_k)$ respectively.

Using translations $T_k : w \mapsto w - \tau_k$ and $T_n : w \mapsto w - \tau_n$, we can let the tip move to the origin as the fixed point of the new coordinate change map, $\Psi^n_k := T_k \circ \Psi^n_{k,\,\text{tip}} \circ T_n^{-1}$ defined on Section 5.1. Thus due to the above commutative diagram, the corresponding tips in ${}_{2d}B_j$ for $j = k, n$ is changed to the origin. Let $\pi_{xy} \circ T_j$ be $T_{2d,\,j}$ for $j = k, n$. This origin is also the fixed point of the map ${}_{2d}\Psi^n_{k,\,\boldsymbol{\xi}} := T_{2d,\,k} \circ {}_{2d}\Psi^n_{k,\,\boldsymbol{\xi},\,\text{tip}} \circ T^{-1}_{2d,\,n}$ where $T_{2d,\,j} = \pi_{xy} \circ T_j$ with $j = k, n$. By the direct calculation, we obtain the expression of the map ${}_{2d}\Psi^n_{k,\,\boldsymbol{\xi}}$ as follows

$$ {}_{2d}\Psi^n_{k,\,\boldsymbol{\xi}} = \pi^{\boldsymbol{\xi}_k}_{xy,\,k} \circ \Psi^n_k(x, y, \boldsymbol{\xi}_n) $$

$$
\begin{aligned}
&= \pi^{\boldsymbol{\xi}_k}_{xy,\,k} \circ \begin{pmatrix} \alpha_{n,\,k} & \sigma_{n,\,k}\, t_{n,\,k} & \sigma_{n,\,k}\, \mathbf{u}_{n,\,k} \\ & \sigma_{n,\,k} & \\ & \sigma_{n,\,k}\, \mathbf{d}_{n,\,k} & \sigma_{n,\,k} \cdot \mathrm{Id}_{m\times m} \end{pmatrix} \begin{pmatrix} x + S^n_{k,\,\boldsymbol{\xi}} \\ y \\ \boldsymbol{\xi}_n + \mathbf{R}_{n,\,k}(y) \end{pmatrix} \\
&= \big(\alpha_{n,\,k}(x + S^n_{k,\,\boldsymbol{\xi}}) + \sigma_{n,\,k} t_{n,\,k}\, y + \sigma_{n,\,k} \mathbf{u}_{n,\,k} \cdot (\boldsymbol{\xi}_n + \mathbf{R}_{n,\,k}(y)),\ \sigma_{n,\,k}\, y\big) \qquad (8.3)
\end{aligned}
$$

where $S^n_{k,\,\boldsymbol{\xi}} = S^n_k(x, y, \boldsymbol{\xi}_n(x,y))$. Then

$$
\begin{aligned}
\mathrm{Jac}\,{}_{2d}\Psi^n_{k,\,\boldsymbol{\xi}} &= \det \begin{pmatrix} \alpha_{n,\,k} \Big(1 + \partial_x S^n_{k,\,\boldsymbol{\xi}} + \displaystyle\sum_{j=1}^m \partial_{z_j} S^n_{k,\,\boldsymbol{\xi}} \cdot \partial_x \xi^j_n\Big) + \sigma_{n,\,k}\, \mathbf{u}_{n,\,k} \cdot \partial_x \boldsymbol{\xi}_n & \bullet \\ 0 & \sigma_{n,\,k} \end{pmatrix} \\
&= \sigma_{n,\,k} \Big(\alpha_{n,\,k} \Big(1 + \partial_x S^n_{k,\,\boldsymbol{\xi}} + \sum_{j=1}^m \partial_{z_j} S^n_{k,\,\boldsymbol{\xi}} \cdot \partial_x \xi^j_n\Big) + \sigma_{n,\,k}\, \mathbf{u}_{n,\,k} \cdot \partial_x \boldsymbol{\xi}_n \Big). \qquad (8.4)
\end{aligned}
$$

If $F \in \mathcal{I}(\bar{\varepsilon})$ has the invariant surfaces as the graph from $I^x \times I^y$ to $I^{\mathbf{z}}$ on every level, then ${}_{2d}\Psi^{k+1}_{k,\,\boldsymbol{\xi}}$ is the conjugation between $({}_{2d}F_{k,\,\boldsymbol{\xi}})^2$ and ${}_{2d}F_{k+1,\,\boldsymbol{\xi}}$ for each $k \in \mathbb{N}$. Then the two dimensional map $F_{2d,\,\boldsymbol{\xi}}$ is called the *formally* infinitely renormalizable map with C^r conjugation. Moreover, the map defined on the equation (8.3) with $n = k+1$, ${}_{2d}\Psi^{k+1}_{k,\,\boldsymbol{\xi}}$ preserves each horizontal line and is the inverse of the horizontal map

$$(x,\ y) \mapsto (f_k(x) - \varepsilon_k(x, y, \boldsymbol{\xi}_k),\ y) \circ (\sigma_k x,\ \sigma_k y)$$

by Proposition 8.1 as follows.

Proposition 8.1. *Let the coordinate change map* ${}_{2d}\Psi^{k+1}_{k,\,\boldsymbol{\xi}}$ *between* $({}_{2d}F_{k,\,\boldsymbol{\xi}})^2$ *and* ${}_{2d}F_{k+1,\,\boldsymbol{\xi}}$ *be* ${}_{2d}\Psi^{k+1}_{k,\,\boldsymbol{\xi}}$ *which is defined on* (8.3) *as the conjugation. Then*

$${}_{2d}\Psi^{k+1}_{k,\,\boldsymbol{\xi}} = H^{-1}_{k,\,\boldsymbol{\xi}} \circ \Lambda^{-1}_k$$

for every $k \in \mathbb{N}$ *where* $H_{k,\,\boldsymbol{\xi}}(x,y) = (f_k(x) - \varepsilon_k(x, y, \boldsymbol{\xi}_k),\ y)$ *and* $\Lambda^{-1}_k(x,y) = (\sigma_k x,\ \sigma_k y)$.

Proof. Recall the definitions of the horizontal-like diffeomorphism H_k and its inverse, H^{-1}_k as follows

$$
\begin{aligned}
H_k(w) &= \ (f_k(x) - \varepsilon_k(w),\ y,\ \mathbf{z} - \boldsymbol{\delta}_k(y, f^{-1}_k(y), \mathbf{0})) \\
H^{-1}_k(w) &= \ (\phi^{-1}_k(w),\ y,\ \mathbf{z} + \boldsymbol{\delta}_k(y, f^{-1}_k(y), \mathbf{0})).
\end{aligned}
$$

Observe that $H_k \circ H^{-1}_k = \mathrm{id}$ and $f_k \circ \phi^{-1}_k(w) - \varepsilon_k \circ H^{-1}_k(w) = x$ for all points $w \in \Lambda^{-1}_k(B)$. Then if we choose the set $\sigma_k \cdot \mathrm{graph}(\boldsymbol{\xi}_{k+1}) \subset \Lambda^{-1}_k(B)$, then the similar identical equation holds. By the definition of the map ${}_{2d}\Psi^n_{k,\,\boldsymbol{\xi}}$, the following equation holds

$$
\begin{aligned}
{}_{2d}\Psi^{k+1}_{k,\,\boldsymbol{\xi}}(x,y) &= \pi^{\boldsymbol{\xi}_k}_{xy} \circ \Psi^{k+1}_k \circ (\pi^{\boldsymbol{\xi}_{k+1}}_{xy})^{-1}(x,y) \\
&= \pi^{\boldsymbol{\xi}_k}_{xy} \circ \Psi^{k+1}_k(x, y, \boldsymbol{\xi}_{k+1}) \\
&= \pi^{\boldsymbol{\xi}_k}_{xy} \circ H_k^{-1} \circ \Lambda_k^{-1}(x, y, \boldsymbol{\xi}_{k+1}) \qquad (8.5) \\
&= \pi^{\boldsymbol{\xi}_k}_{xy} \circ H_k^{-1}(\sigma_k x,\ \sigma_k y,\ \sigma_k \boldsymbol{\xi}_{k+1}) \\
(*) \qquad &= \pi^{\boldsymbol{\xi}_k}_{xy}\big(\phi_k^{-1}(\sigma_k x,\ \sigma_k y,\ \sigma_k \boldsymbol{\xi}_{k+1}),\ \sigma_k y,\ \boldsymbol{\xi}_k(\phi_k^{-1}, \sigma_k y)\big) \\
&= (\ \phi_k^{-1}(\sigma_k x,\ \sigma_k y,\ \sigma_k \boldsymbol{\xi}_{k+1}),\ \sigma_k y\ ).
\end{aligned}
$$

In the above equation, $(*)$ is involved with the fact that $H_k^{-1} \circ \Lambda_k^{-1}(\,\mathrm{graph}(\boldsymbol{\xi}_{k+1})) \subset \mathrm{graph}(\boldsymbol{\xi}_k)$. Let us calculate $H_{k,\,\boldsymbol{\xi}} \circ {}_{2d}\Psi^{k+1}_{k,\,\boldsymbol{\xi}}(x,y)$. The second coordinate function of it is just $\sigma_k y$. The first coordinate function is as follows

$$
\begin{aligned}
& f_k \circ \phi_k^{-1}(\sigma_k x,\ \sigma_k y,\ \sigma_k \boldsymbol{\xi}_{k+1}) - \varepsilon_k\big(\phi_k^{-1}(\sigma_k x,\ \sigma_k y,\ \sigma_k \xi_{k+1}),\ \sigma_k y,\ \boldsymbol{\xi}_k(\phi_k^{-1}, \sigma_k y)\big) \\
(*) \quad =\ & f_k \circ \phi_k^{-1}(\sigma_k x,\ \sigma_k y,\ \sigma_k \boldsymbol{\xi}_{k+1}) - \varepsilon_k \circ H_k^{-1}(\sigma_k x,\ \sigma_k y,\ \sigma_k \boldsymbol{\xi}_{k+1}) \\
=\ & \sigma_k x.
\end{aligned}
$$

Hence, $H_{k,\,\boldsymbol{\xi}} \circ {}_{2d}\Psi^{k+1}_{k,\,\boldsymbol{\xi}}(x,y) = (\sigma_k x,\ \sigma_k y)$. However, $H_{k,\boldsymbol{\xi}} \circ \big(H^{-1}_{k,\,\boldsymbol{\xi}}(x,y) \circ \Lambda_k^{-1}(x,y)\big) = (\sigma_k x,\ \sigma_k y)$. Therefore, by the uniqueness of the inverse map of $H_{k,\boldsymbol{\xi}}(x,y)$,

$$
{}_{2d}\Psi^{k+1}_{k,\,\boldsymbol{\xi}} = H^{-1}_{k,\,\boldsymbol{\xi}} \circ \Lambda_k^{-1}.
$$

□

Proposition 8.1 enable us to define the renormalization of the two dimensional C^r Hénon-like maps as the extension of renormalization of the analytic Hénon-like maps.

Definition 8.1. Let $F : (x,y) \mapsto (f(x) - \varepsilon(x,y),\ x)$ be a C^r Hénon-like map with $r \geq 2$. If F is renormalizable, then RF, the *renormalization* of F is defined as follows

$$
RF = (\Lambda \circ H) \circ F^2 \circ (H^{-1} \circ \Lambda^{-1})
$$

where $H(x,y) = (f(x) - \varepsilon(x,y),\ y)$. Define the linear scaling map $\Lambda(x,y) = (sx, sy)$ if $s : J \to I$ is the orientation reversing affine scaling and J is minimal such that $J \times I$ is invariant under $H \circ F^2 \circ H^{-1}$.

If F is renormalizable n times, then the above definition can be applied to $R^k F$ for $1 \leq k \leq n$ successively. Two dimensional map ${}_{2d}F_{n,\,\boldsymbol{\xi}}$ with the C^r function $\boldsymbol{\xi}_n$ is the same as $R^n F_{2d,\,\boldsymbol{\xi}}$ by Lemma 8.1 and the above definition. Thus if the maps ${}_{2d}F_{n,\,\boldsymbol{\xi}}$ are defined on every $n \in \mathbb{N}$, then the map ${}_{2d}F_{n,\,\boldsymbol{\xi}}$ is realized to be $R^n F_{2d,\,\boldsymbol{\xi}}$ and it is called the n^{th} *renormalization* of $F_{2d,\,\boldsymbol{\xi}}$.

8.2. Universality of two dimensional Hénon-like maps. Recall that Q is an F invariant surface which is tangent to E^{pu} over the critical Cantor set $\mathcal{O}_F$. The critical Cantor set restricted to any invariant surface Q, say $\mathcal{O}_{F|_Q}$, is the same as $\mathcal{O}_F$. The ergodic measure on $\mathcal{O}_{F_{2d,\boldsymbol{\xi}}}$ is defined as the push forward measure μ on $\mathcal{O}_F$ by the map $\pi^{\boldsymbol{\xi}}_{xy}$. In particular, it is defined as follows

$$
\mu_{2d,\,\boldsymbol{\xi}}\big(\pi^{\boldsymbol{\xi}}_{xy}(\mathcal{O}_F \cap B^n_{\mathbf{w}})\big) = \mu_{2d,\,\boldsymbol{\xi}}\big(\pi^{\boldsymbol{\xi}}_{xy}(\mathcal{O}_F) \cap \pi^{\boldsymbol{\xi}}_{xy}(B^n_{\mathbf{w}})\big) = \frac{1}{2^n}.
$$

Since $\pi^{\boldsymbol{\xi}}_{xy}(\mathcal{O}_F)$ is independent of $\boldsymbol{\xi}$, $\mu_{2d,\,\boldsymbol{\xi}}$ is also independent of $\boldsymbol{\xi}$. Then we suppress $\boldsymbol{\xi}$ in the notation of the measure μ_{2d}. Let us define the *average Jacobian* of $F_{2d,\,\boldsymbol{\xi}}$

$$b_{2d} = \exp \int_{\mathcal{O}_{F_{2d}}} \log \operatorname{Jac} F_{2d,\,\boldsymbol{\xi}} \; d\mu_{2d}.$$

Observe that this average Jacobian is independent of the surface map $\boldsymbol{\xi}$.

Lemma 8.2. *Let $F \in \mathcal{I}(\bar{\varepsilon})$ with a sufficiently small perturbation of toy model map satisfying $\|\partial_{\mathbf{z}} \boldsymbol{\delta}\| \ll b_{2d}$.* [6] *Suppose that there exist R^nF invariant C^r surfaces each of which, say Q_n, is tangent to E^{pu} over the critical Cantor set for $2 \leq r < \infty$. Suppose also that $Q_n = graph\,(\boldsymbol{\xi}_n)$ where $\boldsymbol{\xi}_n$ is C^r map from $I^x \times I^y$ to $I^{\mathbf{z}}$. Let $R^nF_{2d,\,\boldsymbol{\xi}}$ be $\pi^{\boldsymbol{\xi}_n}_{xy} \circ F_n|_{Q_n} \circ (\pi^{\boldsymbol{\xi}_n}_{xy})^{-1}$ for each $n \geq 1$. Then*

$$\operatorname{Jac} R^n F_{2d,\,\boldsymbol{\xi}} = b_{2d}^{2^n}\; a(x)(1 + O(\rho^n))$$

where b_{2d} is the average Jacobian of $F_{2d,\,\boldsymbol{\xi}}$ and $a(x)$ is the universal function of x for some positive $\rho < 1$.

Proof. By the distortion Lemma 4.1 and Corollary 4.2, we obtain

$$\operatorname{Jac} F^{2^n}_{2d,\,\boldsymbol{\xi}} = b_{2d}^{2^n}(1 + O(\rho^n)).$$

Moreover, the chain rule implies that

$$\operatorname{Jac} R^n F_{2d,\,\boldsymbol{\xi}} = b_{2d}^{2^n}\; \frac{\operatorname{Jac}{}_{2d}\Psi^n_{0,\,\boldsymbol{\xi}}(w)}{\operatorname{Jac}{}_{2d}\Psi^n_{0,\,\boldsymbol{\xi}}(R^nF_{2d,\,\boldsymbol{\xi}}(w))}(1 + O(\rho^n))$$

where $w = (x, y, \mathbf{z})$. After letting the tip on every level move to the origin by the appropriate linear map, the equation (8.4) implies that

$$\operatorname{Jac}{}_{2d}\Psi^n_{0,\,\boldsymbol{\xi}} = \sigma_{n,\,0}\big(\alpha_{n,\,0} \cdot \partial_x \big(x + S^n_0(x, y,\, \boldsymbol{\xi}_n)\big) + \sigma_{n,\,0}\mathbf{u}_{n,\,0} \cdot \partial_x \boldsymbol{\xi}_n\big). \tag{8.6}$$

Then in order to have the universal expression of the Jacobian, we need the asymptotic of the following maps

$$\partial_x \big(x + S^n_0(x, y,\, \boldsymbol{\xi}_n)\big) \quad \text{and} \quad \frac{\sigma_{n,\,0}}{\alpha_{n,\,0}}\, \partial_x \boldsymbol{\xi}_n.$$

By Lemma 5.9,

$$x + S^n_0(x, y,\, \boldsymbol{\xi}_n) = v_*(x) + a_F\, y^2 + \sum_{j=1}^{m} a_{F,\,j}\; y \cdot \xi^j_n + \sum_{1 \leq i \leq j \leq m} a_{F,\,ij}\; \xi^i_n \cdot \xi^j_n + O(\rho^n)$$

with C^1 convergence where $v_*(x)$ is the universal function. Thus

$$\partial_x \big(x + S^n_0(x, y,\, \boldsymbol{\xi}_n)\big) = v_*'(x) + \sum_{j=1}^{m} a_{F,\,j}\; y \cdot \partial_x \xi^j_n + \sum_{1 \leq i \leq j \leq m} a_{F,\,ij}\; (\partial_x \xi^i_n \cdot \xi^j_n + \xi^i_n \cdot \partial_x \xi^j_n) + O(\rho^n).$$

By Lemma 7.6, we see $\|\partial_x \boldsymbol{\xi}_n\| \leq C\bar{\varepsilon}\,\sigma^n$. Then

$$\partial_x \big(x + S^n_0(x, y,\, \boldsymbol{\xi}_n)\big) = v_*'(x) + O(\rho^n). \tag{8.7}$$

By the equation (7.6) in Lemma 7.6,

---

[6] Every matrix norm is greater than equal to the spectral radius of any given matrix.

$$\frac{\sigma_{n,\,0}}{\alpha_{n,\,0}}\,\frac{\partial \boldsymbol{\xi}_n}{\partial x} = \partial_x \boldsymbol{\xi}(\bar{x}, \bar{y}) \cdot \left[1 + \partial_x S^n_0(x, y,\, \boldsymbol{\xi}_n) + \frac{\sigma_{n,\,0}}{\alpha_{n,\,0}}\,\mathbf{u}_{n,\,0} \cdot \frac{\partial \boldsymbol{\xi}_n}{\partial x}\right]$$

Thus we obtain that $\displaystyle \frac{\sigma_{n,\,0}}{\alpha_{n,\,0}}\,\frac{\partial \xi_n}{\partial x} = \frac{\partial_x \boldsymbol{\xi}(\bar{x}, \bar{y})}{1 - \mathbf{u}_{n,\,0} \cdot \partial_x \boldsymbol{\xi}(\bar{x}, \bar{y})}\,\bigl(1 + \partial_x S^n_0(x, y,\, \boldsymbol{\xi}_n)\bigr)$

where $(\bar{x}, \bar{y}) \in B(F_{2d,\,\xi})$ for $1 \leq i \leq m$. Moreover, $(\bar{x}, \bar{y})$ converges to the origin $(0, 0)$ as $n \to \infty$ exponentially fast by Corollary 3.2.

$$\operatorname{diam}({}_{2d}\Psi^n_{0,\,\boldsymbol{\xi}}(B)) \leq \operatorname{diam}(\Psi^n_0(B)) \leq C\sigma^n$$

for some $C > 0$. In addition to the exponential convergence of $\partial_x \boldsymbol{\xi}(\bar{x}, \bar{y})$ to $\partial_x \boldsymbol{\xi}(0, 0)$, $\mathbf{u}_{n,\,0}$ converges to $\mathbf{u}_{*,\,0}$ super exponentially fast. Then,

$$\frac{\sigma_{n,\,0}}{\alpha_{n,\,0}}\,\mathbf{u}_{n,\,0} \cdot \partial_x \boldsymbol{\xi}_n = \frac{\mathbf{u}_{*,\,0} \cdot \partial_x \boldsymbol{\xi}}{1 - \mathbf{u}_{*,\,0} \cdot \partial_x \boldsymbol{\xi}}\; v'_*(x) + O(\rho^n). \tag{8.8}$$

Let $(x', y') = w' = R^n F_{2d,\,\boldsymbol{\xi}}(w)$. Then we obtain

$$\frac{\operatorname{Jac}{}_{2d}\Psi^n_{0,\,\boldsymbol{\xi}}(w)}{\operatorname{Jac}{}_{2d}\Psi^n_{0,\,\boldsymbol{\xi}}(w')} = \frac{1 + \partial_x(S^n_{0,\,\boldsymbol{\xi}}(w)) + \dfrac{\sigma_{n,\,0}}{\alpha_{n,\,0}}\,\mathbf{u}_{n,\,0} \cdot \partial_x \boldsymbol{\xi}_n(x, y)}{1 + \partial_x(S^n_{0,\,\boldsymbol{\xi}}(w')) + \dfrac{\sigma_{n,\,0}}{\alpha_{n,\,0}}\,\mathbf{u}_{n,\,0} \cdot \partial_x \boldsymbol{\xi}_n(x', y')} \tag{8.9}$$

where $S^n_0(x, y,\, \boldsymbol{\xi}_n) = S^n_{0,\,\boldsymbol{\xi}}(x, y)$. The translation does not affect Jacobian determinant and each translation from tip to the origin converges to the map $w \mapsto \tau_\infty$ exponentially fast where τ_∞ is the tip of two dimensional degenerate map $F_*(x, y) = (f_*(x),\ x)$ which is the renormalization fixed point. Then by the similar calculation in Theorem 5.10, the equation (8.9) converges to the following universal function exponentially fast.

(8.10)

$$\begin{aligned}
\lim_{n\to\infty} \frac{\operatorname{Jac}{}_{2d}\Psi^n_{0,\,\boldsymbol{\xi}}(w)}{\operatorname{Jac}{}_{2d}\Psi^n_{0,\,\boldsymbol{\xi}}(w')} &= \frac{v'_*(x - \pi_x(\tau_\infty)) + \dfrac{\mathbf{u}_{*,\,0} \cdot \partial_x \boldsymbol{\xi}(\pi_{xy}(\tau_F))}{1 - \mathbf{u}_{*,\,0} \cdot \partial_x \boldsymbol{\xi}(\pi_{xy}(\tau_F))}\; v'_*(x - \pi_x(\tau_\infty))}{v'_*(f_*(x) - \pi_y(\tau_\infty)) + \dfrac{\mathbf{u}_{*,\,0} \cdot \partial_x \boldsymbol{\xi}(\pi_{xy}(\tau_F))}{1 - \mathbf{u}_{*,\,0} \cdot \partial_x \boldsymbol{\xi}(\pi_{xy}(\tau_F))}\; v'_*(f_*(x) - \pi_y(\tau_\infty))} \\
&= \frac{v'_*(x - \pi_x(\tau_\infty))}{v'_*(f_*(x) - \pi_y(\tau_\infty))} \equiv a(x).
\end{aligned}$$

□

Theorem 8.3 (Universality of C^r Hénon-like maps with C^r conjugation for $2 \leq r < \infty$)**.** *Let Hénon-like map $F_{2d,\,\boldsymbol{\xi}}$ be the C^r map with $2 \leq r < \infty$ which is defined on (8.2). Suppose that $F_{2d,\,\boldsymbol{\xi}}$ is infinitely renormalizable. Then*

$$R^n F_{2d,\,\boldsymbol{\xi}}(x, y) = (f_n(x) - b_{2d}^{2^n}\, a(x)\, y\, (1 + O(\rho^n)),\ x) \tag{8.11}$$

where b_{2d} is the average Jacobian of $F_{2d,\,\boldsymbol{\xi}}$ and $a(x)$ is the universal function for some $0 < \rho < 1$.

Proof. By the smooth conjugation of two dimensional map and $F_n|_{Q_n}$, we see that

$$R^n F_{2d,\,\boldsymbol{\xi}}(x,\ y) = (f_n(x) - \varepsilon_n(x, y, \boldsymbol{\xi}_n),\ x)$$

Let $\varepsilon_n(x, y, \boldsymbol{\xi}_n)$ be $\varepsilon_{n,\,\boldsymbol{\xi}_n}(x, y)$. Then the Jacobian of $R^n F_{2d,\,\boldsymbol{\xi}}$ is $\partial_y \varepsilon_{n,\,\boldsymbol{\xi}_n}(x, y)$. By Lemma

8.2, $\partial_y \varepsilon_{n,\boldsymbol{\xi}_n}(x,y) = b_{2d}^{2^n}\, a(x)(1+O(\rho^n))$. Then

$$\varepsilon_{n,\boldsymbol{\xi}_n}(x,y) = b_{2d}^{2^n}\, a(x)\, y\, (1+O(\rho^n)) + U_n(x).$$

The map $U_n(x)$ which depends only on the variable x can be incorporated to $f_n(x)$. □

Theorem 8.4. *Let $R^kF \in \mathcal{I}(\bar{\varepsilon}^{2^k})$ be the map with invariant surfaces $Q_k \equiv graph(\boldsymbol{\xi}_k)$ tangent to E^{pu} over the critical Cantor set. Then the coordinate change map ${}_{2d}\Psi^n_{k,\boldsymbol{\xi}}$ is as follows*

$$ {}_{2d}\Psi^n_{k,\boldsymbol{\xi}} = \big(\, \alpha_{n,k}\,(\,x + {}_{2d}S^n_k(w)) + \sigma_{n,k}\cdot {}_{2d}t_{n,k}\cdot y,\ \ \sigma_{n,k}\, y\,\big) \tag{8.12}$$

where $x + {}_{2d}S^n_k(w)$ has the asymptotic

$$x + {}_{2d}S^n_k(w) = v_*(x) + a_{F,k}\, y^2 + O(\rho^{n-k})$$

where $|\,a_{F,k}| = O(\varepsilon^{2^k})$.

Proof. By Proposition 8.1, the coordinate change map, ${}_{2d}\Psi^n_{k,\xi}$ is the composition of the inverse of horizontal diffeomorphisms with linear scaling maps as follows

$$H^{-1}_{k,\boldsymbol{\xi}} \circ \Lambda^{-1}_k \circ H^{-1}_{k+1,\boldsymbol{\xi}} \circ \Lambda^{-1}_{k+1} \circ \cdots \circ H^{-1}_{n,\boldsymbol{\xi}} \circ \Lambda^{-1}_n .$$

Then after reshuffling non-linear and linear parts separately by the direct calculations and letting the tip move to the origin by the appropriate translations on each levels, the coordinate change map is of the form (8.12). However, the calculation in Section 7.2 in [CLM] can be used because analyticity is not required for any calculation of recursive formulas. Thus we have the following estimation

$$x + {}_{2d}S^n_k(x,y) = v_*(x) + a_{F,k}\, y^2 + O(\rho^{n-k})$$

where $|\,a_{F,k}| = O(\varepsilon^{2^k})$. Alternatively, let us choose the equation (8.3)

$${}_{2d}\Psi^n_{k,\boldsymbol{\xi}} = \big(\alpha_{n,k}(x + S^n_{k,\boldsymbol{\xi}}) + \sigma_{n,k}t_{n,k}\, y + \sigma_{n,k}\mathbf{u}_{n,k}\cdot(\boldsymbol{\xi}_n + \mathbf{R}_{n,k}(y)),\ \sigma_{n,k}\, y\big)$$

where $S^n_{k,\boldsymbol{\xi}}(x,y) = S^n_k(x,y,\boldsymbol{\xi}_n(x,y))$. By Proposition 7.6, the map $\boldsymbol{\xi}_n$ is

$$\boldsymbol{\xi}_n(x,y) = \mathbf{c}y + \boldsymbol{\eta}(y) + O(\rho^n)$$

where $\boldsymbol{\eta} = (\eta_1, \eta_2, \ldots, \eta_m)$ is quadratic or higher order terms with $\|\boldsymbol{\eta}\|_{C^1} \leq C_0\sigma^{n-k}$ for some $C_0 > 0$. Recall that $\mathbf{u}_{n,k}$ converges to $\mathbf{u}_{*,k}$ super exponentially fast and $\|\mathbf{R}_{n,k}\| \leq C_1\sigma^{n-k}$ for some $C_1 > 0$. Recall also that $\alpha_{n,k} = \sigma^{2(n-k)}(1+O(\rho^n))$ and $\sigma_{n,k} = (-\sigma)^{n-k}(1+O(\rho^n))$. Hence, we define each terms of ${}_{2d}\Psi^n_{k,\boldsymbol{\xi}}$ appropriately

$$\begin{aligned} {}_{2d}S^n_k(x,y) &= S^n_{k,\boldsymbol{\xi}}(x,y) + \frac{\alpha_{n,k}}{\sigma_{n,k}}\,\mathbf{u}_{n,k}\cdot\big[\boldsymbol{\xi}_n(x,y) - \mathbf{c}y + \mathbf{R}_{n,k}(y)\big] \\ {}_{2d}t_{n,k} &= t_{n,k} + \mathbf{u}_{n,k}\cdot\mathbf{c} \end{aligned}$$

as desired. □

9. Unbounded geometry of critical Cantor set

The unbounded geometry of the Cantor set, $\mathcal{O}_F$ of small perturbation of the toy model map, $F \in \mathcal{I}(\bar{\varepsilon})$ with $b_1 \gg \|\partial_{\mathbf{z}} \boldsymbol{\delta}\|$ is involved with that of the map on the invariant surfaces of each level, $F|_Q$. Since the C^r conjugation preserves this property, the fact that the Cantor set of C^r Hénon-like map F_{2d} has the unbounded geometry is sufficient to show the same property of $\mathcal{O}_F$.

Recall that the minimal distance between two boxes B_1, B_2 is the infimum of the distance between all points of each boxes, $\operatorname{dist}_{\min}(B_1, B_2)$.

Definition 9.1. $F \in \mathcal{I}(\bar{\varepsilon})$ has *bounded geometry* if

$$\begin{aligned} \operatorname{dist}_{\min}(B^{n+1}_{\mathbf{w}v}, B^{n+1}_{\mathbf{w}c}) &\asymp \operatorname{diam}(B^{n+1}_{\mathbf{w}\nu}) \quad \text{for } \nu \in \{v, c\} \\ \operatorname{diam}(B^n_{\mathbf{w}}) &\asymp \operatorname{diam}(B^{n+1}_{\mathbf{w}\nu}) \quad \text{for } \nu \in \{v, c\} \end{aligned}$$

for all $\mathbf{w} \in W^n$ and for all $n \geq 0$.

By the definition of each $B^n_{\mathbf{w}}$, if F does not have bounded geometry, then we call $\mathcal{O}_F$ has bounded geometry. Otherwise, we call $\mathcal{O}_F$ has *unbounded geometry*.

Let F_{2d} be an infinitely renormalizable two dimensional Hénon-like map and b_1 be the average Jacobian of F_{2d}. Then the unbounded geometry of the Cantor set depends on Universality theorem and the asymptotic of the tilt, $-t_k \asymp b_1^{2^k}$ but it does not depend on the analyticity of the map. Moreover, unbounded geometry holds if we choose $n > k$ such that $b_{2d} \asymp \sigma^{n-k}$ for every sufficiently large k. This is true on the parameter space of b_{2d} almost everywhere with respect to Lebesgue measure.

Theorem 9.1 ([HLM])**.** *The given any $0 < A_0 < A_1$, $0 < \sigma < 1$ and any $p \geq 2$, the set of parameters $b \in [0, 1]$ for which there are infinitely many $0 < k < n$ satisfying*

$$A_0 < \frac{b^{p^k}}{\sigma^{n-k}} < A_1$$

is a dense G_δ set with full Lebesgue measure.

Theorem 9.2. *Let $m+2$ dimensional Hénon-like map, $F \in \mathcal{I}(\bar{\varepsilon})$ be a small perturbation of the toy model map with $\|\partial_{\mathbf{z}} \boldsymbol{\delta}\| \ll b_1$ where b_1 is the average Jacobian of $F_{2d,\boldsymbol{\xi}}$. Let F_{b_1} be the parametrized $m+2$ dimensional Hénon-like map for $b_1 \in [b_\circ, b_\bullet]$ where $\|\partial_{\mathbf{z}} \boldsymbol{\delta}\| \ll b_\circ < b_\bullet$. Then there exists G_δ subset S with full Lebesgue measure of $[b_\circ, b_\bullet]$ such that the critical Cantor set $\mathcal{O}_{F_{b_1}}$ has unbounded geometry.*

Proof. The comparison of minimal distances between two adjacent boxes and the diameter of each boxes for every level. Two dimensional invariant surface under F_{b_1} enable us to apply the proof of two dimensional Hénon-like maps. See the proof of Theorem 6.3 in [Nam3] for unbounded geometry of the critical Cantor set. $\square$
